## 1. Introduction

The recent requirement for EU Mission Ocean funded projects to ensure their data/products are available via EMODnet has identified a need for EMODnet to provide clear information on the data submission pathways and support available.

In late February 2024, EMODnet Ingestion organised the [first webinar](#) for these projects and was “designed to inform EU project data management plans, and to optimise the pipeline of marine knowledge from data collection and curation to submission into the EMODnet service”. Following this webinar and given the number of requests arriving to the EMODnet Biology Data Management Team, it was decided that a workshop focused on EMODnet Biology’s work would help answer some of the questions and create resources that could be used by the projects.

The workshop was aimed at representatives (ideally those responsible for the data management) of recent and ongoing EU Mission Ocean research projects that work with marine biodiversity data. Its objective was to share EMODnet’s expertise and experience in marine biodiversity data management to facilitate the publication of data and products from EU-funded projects. It aimed to provide detailed insights into EMODnet Biology’s capabilities, demonstrate how EMODnet Biology can support EU projects, and offer specific guidance on publishing projects biodiversity data and products.

Before the workshop a questionnaire designed to collect information on data collected by the projects, on data management practices and on major challenges in terms of data management and sharing was distributed to 59 representatives of EU projects and results were used to adapt the workshop agenda to the participants’ needs.

In addition, in order to share information on types of biological data collected and on data availability and data management procedures adopted by recent EU projects, 10 representatives of EU projects were invited to present short pitches (see list of project pitches) and an online poll through Mentimeter was used during the workshop, to collect additional information from the participants.

The workshop was attended by 56 participants, which included 44 representatives from EU projects and from the EU Commission and 13 EMODnet project participants.

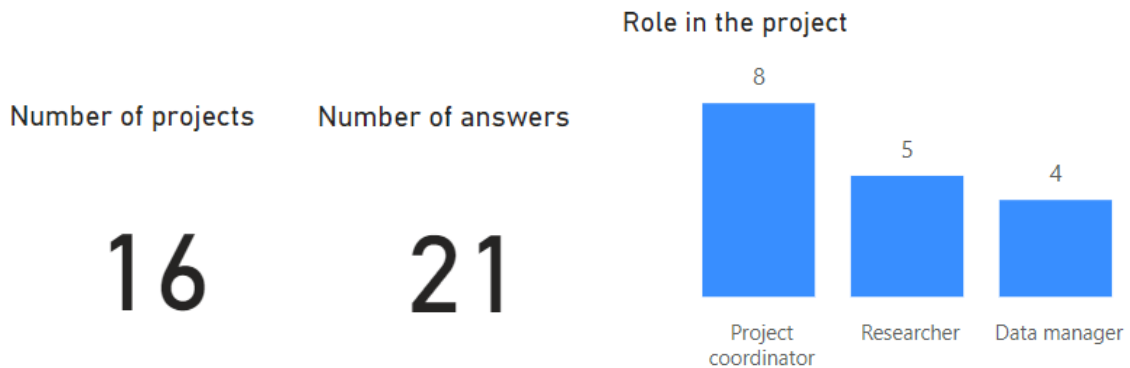

The presentations are available in the annexes and the recording of the event are available on the EMODnet YouTube channel:

- Day 1- <https://www.youtube.com/watch?v=K77ztSKBSC4>
- Day 2- <https://www.youtube.com/watch?v=TfYPEtUkk2Y>

## 2. Pre-workshop survey results

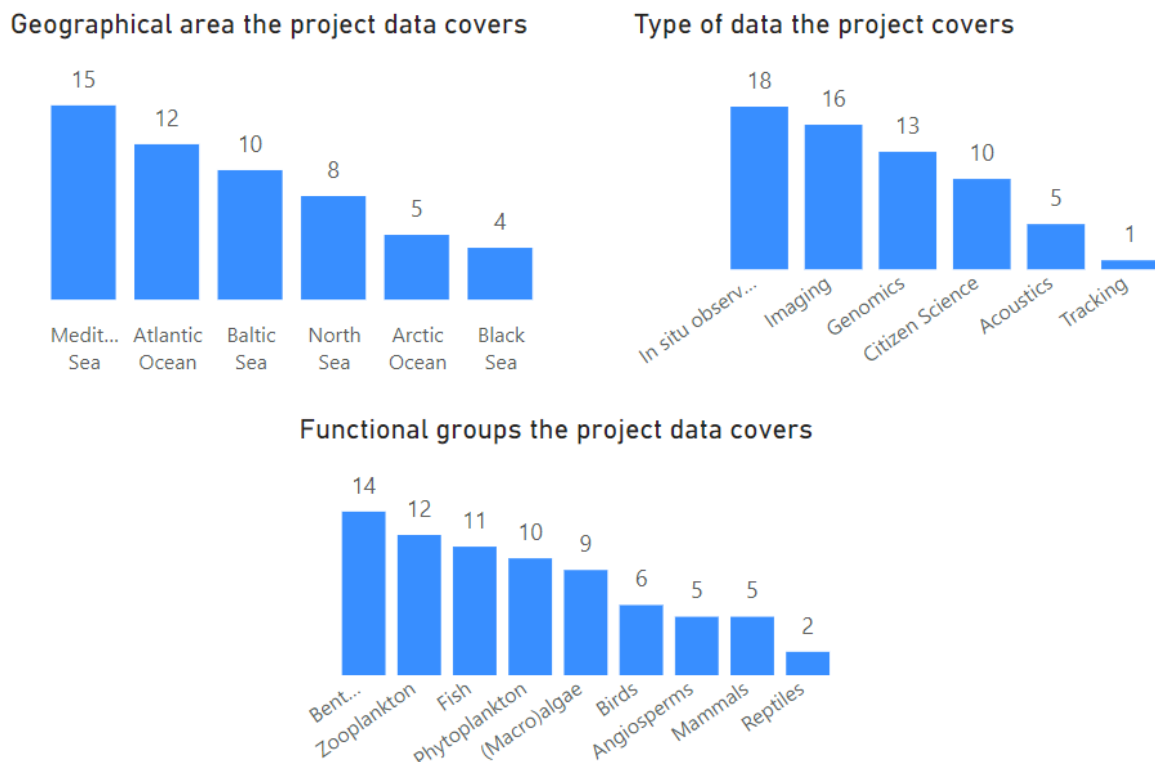

The section includes a description of all questions asked in the survey sent to the various EU Mission Ocean funded projects and the results obtained.

### Project Information

### Research and Data Overview

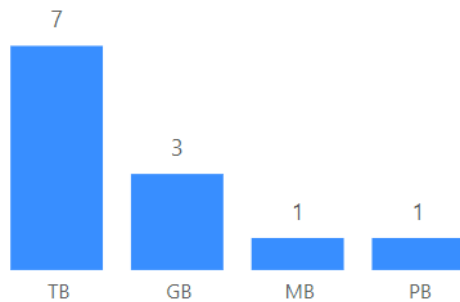

All European marine regions are covered by the projects, with highest participation from the Mediterranean and Atlantic Ocean regions. Most of the data consist of *in-situ* observations, many projects cover more recent data types, such as imaging and genomic data. Data stemming from citizen science activities is also common in the feedback received from the projects. The project's data are covering all functional groups, with benthic (fauna and algae), pelagic (zooplankton and phytoplankton) and fish being the most common groups.

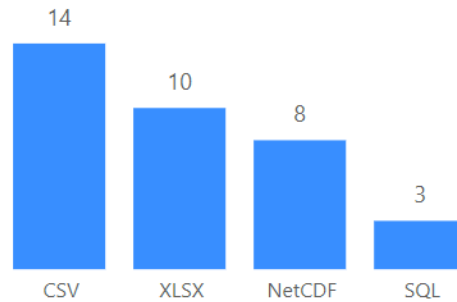

Data size can be quite high for some types of data (terabytes) and data formats are heterogeneous, with CSV being the most frequently used.

#### Data Management Practices

**Size of the data the project covers**

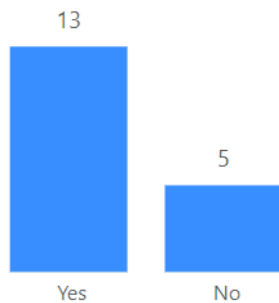

**Format of the data the project covers**

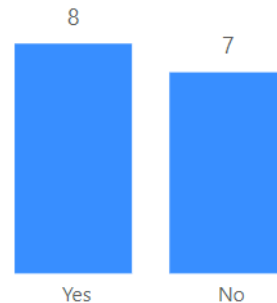

#### Data Collection and Storage Practices

Most projects have a data management plan, but almost half of the respondents do not use data standards or existing practices.

**The project has a Data Management Plan?**

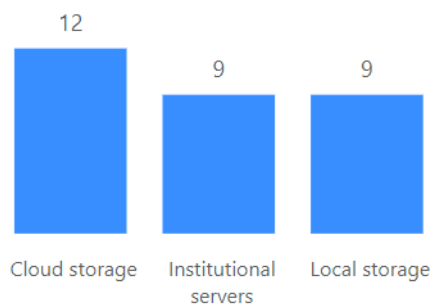

**The project uses data standards/practices?**

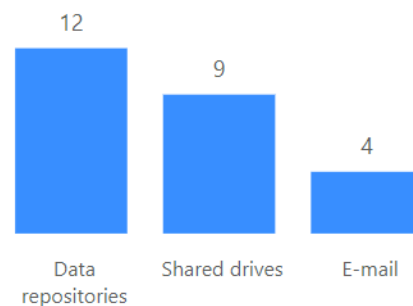

#### Data Sharing and Accessibility

Data sharing is in many cases still on a local scale (local or institutional servers) instead of cloud storage. Nevertheless, for almost 50% of the projects the data is shared to data repository systems or shared drives.

**Storing of the project data**

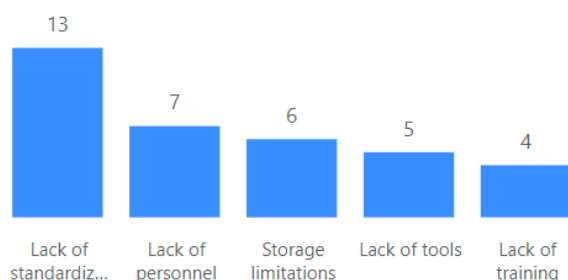

**Sharing of the project data**

### Challenges and Gaps

The main challenge identified by the project is the lack of standardized data practices. Lack of resources (personnel and storage) was also a common identified challenge. The main gaps were related to inadequate metadata documentation and lack of interoperability.

**Challenges in managing the project data**

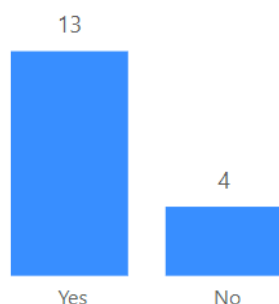

**Gaps in managing the project data**

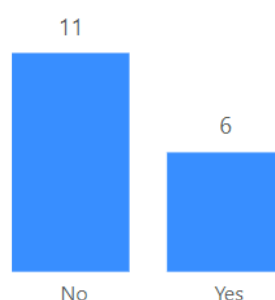

### Awareness and Use of the EMODnet Data Portal

**Awareness of EMODnet Biology**

**Use of EMODnet Biology data/products**

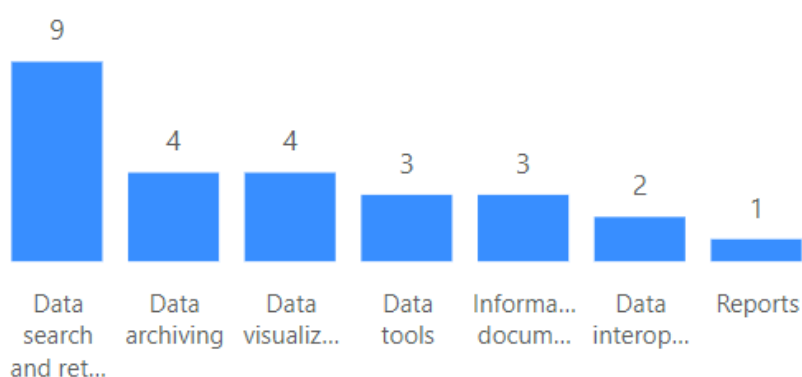

The projects are mostly aware of EMODnet Biology, but most of them have never used data or products published by the thematic lot.

### What features or services you find most valuable in EMODnet Biology

According to the results, the EU projects mostly use EMODnet Biology as a data retrieval aggregator. A few indicate it as a system for data archiving and visualization. In particular, the project GES4SEA mentioned that some EMODnet Biology data products can be interesting to support their project implementation.

**Valuable features of EMODnet Biology**

Suggestions to encourage the use EMODnet Biology:

- Integration with DTO: EMODnet Biology seems to be the mostly widely known repository for biodiversity data (CLIMAREST);
- Availability of complete, harmonized, historical data series until present day from the whole Baltic Sea area (ProtectBaltic);
- Improvement of ease for downloading data (OBAMA-NEXT);
- Improve availability of genomics and microbiome data (BlueRemediomics)
- Availability of freely available abundance data (GES4SEA)
- Development of a literature tracking service, similar to the one developed in GBIF (<https://www.gbif.org/literature-tracking>) (ANERIS)

How can EMODnet Biology better support data management needs?

The list below captures the feedback given by the workshop participants:

- EMODnet should be entitled to reach out to specific consortia to facilitate data mobilization and improve FAIR data availability. The biggest challenge has been to get people to care/engage with data management;
- Enlarge the partnership to include additional data providers;
- Provide practical support at the consortia level;
- Facilitate to overall data management process;
- Add more functionality for genomics data

In summary, some projects would like to have some more support from the EMODnet Biology in taking up the data management task and the flow of data to the portal, making data management as easy as possible.

Topics needed to be covered in the November workshop?

The online participants were asked what they like to learn from the workshop. In other words, we checked for their expectations. The following three aspects were put forward:

- Data standardization to support interoperability for data ingestion
- Better leverage genomics data
- Data provenance services and literature tracking

### 3. Workshop agenda

Time	Speaker	Title
10:00	Marina Lipizer	Aim and agenda (10')
10:10	Zoi Konstantinou -	Short introduction by DG MARE – representing also DG Research (Nicolas Segebarth) (5')
10:20	Joana Beja	1 - EMODnet Biology (15')
10:35	Nikola Holodkov	2 - Outcomes from questionnaire (10')
10:45	All	Q&A (10')
10:55		3 - Project pitches (15') BlueRemediomics - Samuel Chaffron (CNRS) Biodiversa MOSTFUN - Laura Garzoli (CNR) AtlantECO, BiOcean5D, BlueCloud2026 - Meike Vogt (ETHZ)
11:10		Coffee break
11:30	Ruben Perez	EMODnet Biology data guidance (35') - Data management 101: FAIR, licenses, storage, provenance, standards, vocabularies

11:05		Q&A (10')
11:15	Salvador Fernandez	EMODnet Biology product guidance (15') Preferred output NetCDF CF Compliance COARDS Compliance
11:30		Coffee break
12:00	Marina Lipizer	EMODnet Biology tools and services (15') <ul style="list-style-type: none"> <li>- Data preparation (training/documentation resources -&gt; courses, tutorials and manuals)</li> <li>- Access data/metadata</li> <li>- Access products</li> </ul>
12:15		Q&A/ Participants feedback
13:00		End of day 2

## 4. Workshop outcomes

This workshop represented the first EMODnet Biology initiative targeting specifically EU Mission Ocean funded research projects and aimed at sharing information on the thematic lot's tools and services and to collect needs and requirements from the EU projects representatives. The workshop followed the [‘EMODnet webinar for European Research and Innovation and Mission: Restore our Ocean and Waters projects’](#) held in late February 2024 which provided generic guidance on data submission via the EMODnet Ingestion facility.

As highlighted by the participants, marine biodiversity data are heterogeneous, spanning from traditional microscopy determinations to imaging, genomics and acoustics, which represents a growing challenge for data management and curation.

The workshop provided a comprehensive overview of what EMODnet Biology offers in terms of data management **guidance**, data **resources**, data product **guidance**, **tools** and **services** to facilitate data and products publication according to the **FAIR** (findable, accessible, interoperable, re-usable) principles. The agenda items aimed in particular in providing information on: training resources, data quality control tools, data and metadata standardization to improve interoperability, to address the challenges and gaps identified in the pre-workshop questionnaire.

From the point of view of EU Mission Ocean attending projects, the discussion highlighted, on one side, the difficulty in addressing data management due to the specific knowledge required, the limited availability of dedicated funds for data curation, the high heterogeneity of “biological data” and on the other side the importance of data quality control and metadata availability that is able to provide information on the overall data quality level, indicating whether a peer review was carried out, or if data was collected from citizen science or monitoring efforts.

The importance, yet still overlooked, of data curation has been underlined.

According to the online poll, the major types of marine biodiversity data produced within projects represented at the workshop originate from: observations, genomic and imaging (Fig. 2, top) and data sharing faces several **challenges** such as: data restrictions, lack of human or technical resources for data management, difficulties in data formatting according to standards (e.g Darwin Core) and in using vocabularies (Fig. 2, bottom).

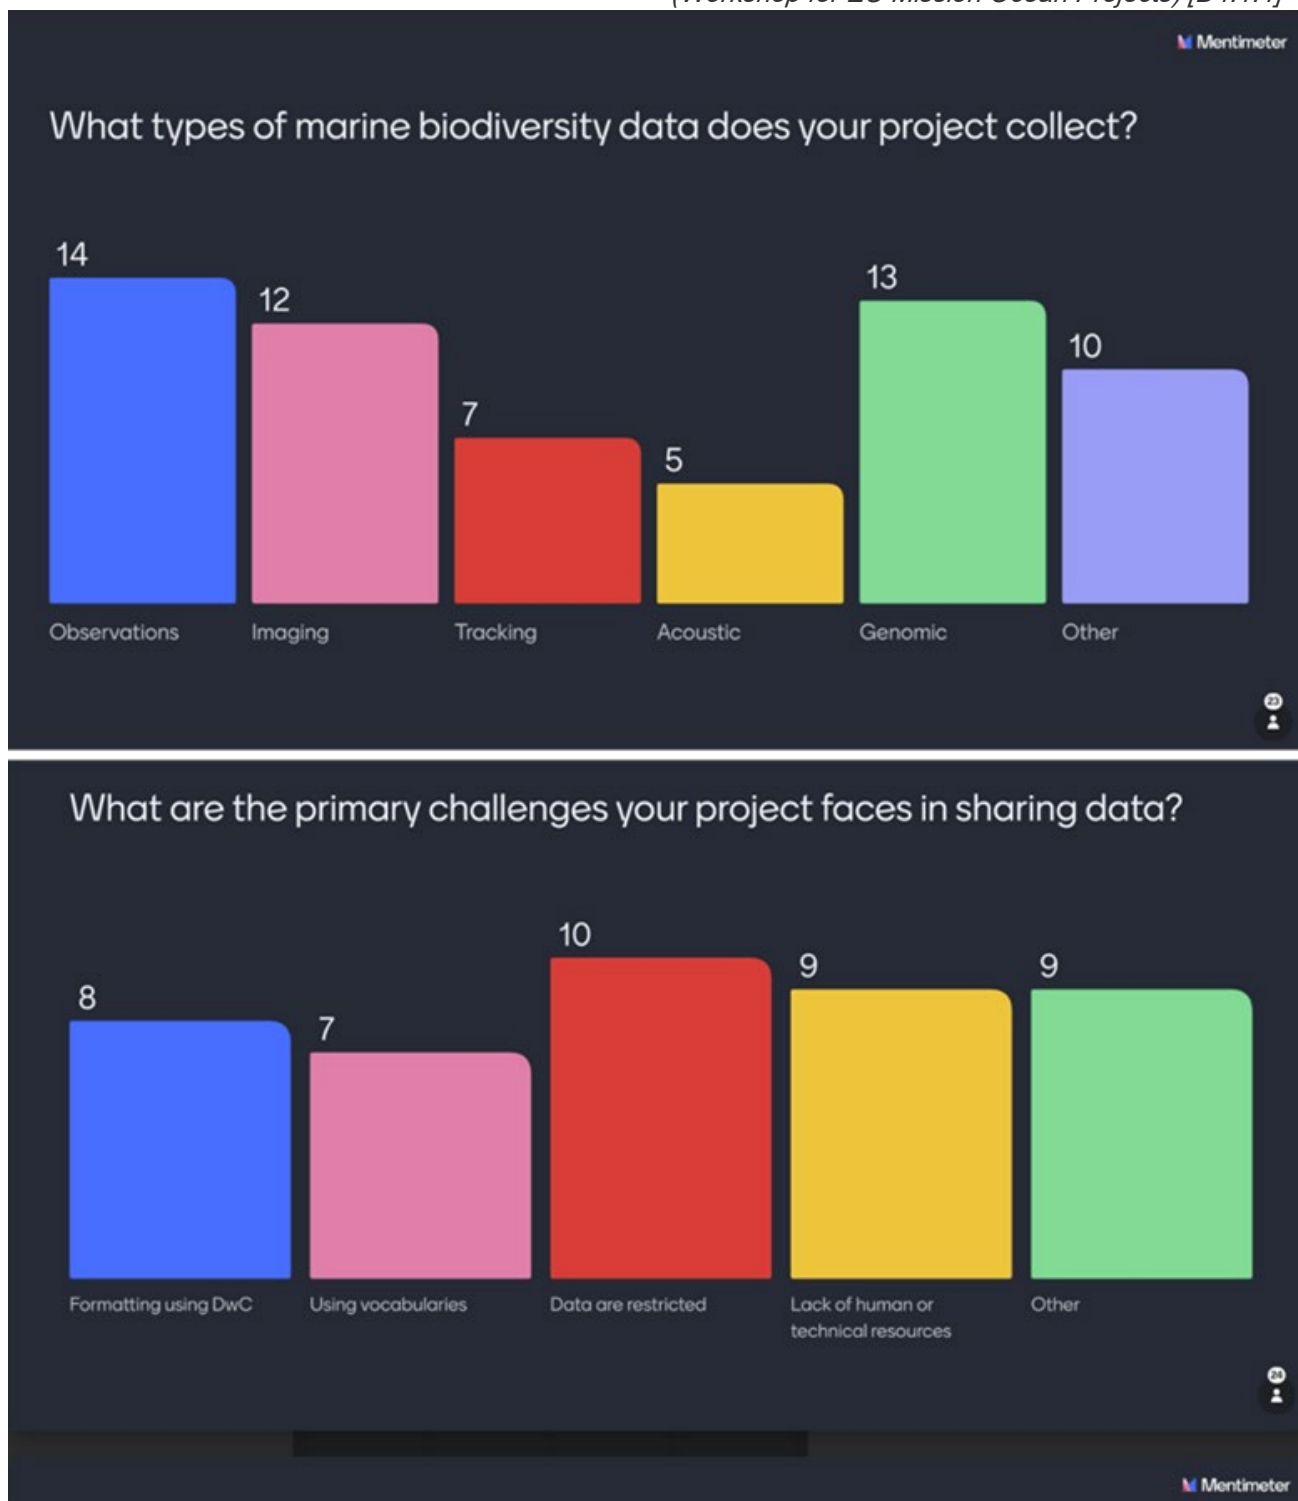

Fig. 2: Results from the online poll collected during the workshop. Types of marine biodiversity data (top) and main challenges in sharing data (bottom).

The main tools, guidelines, tutorials and online courses made available by EMODnet Biology (see presentations in the Annex) were presented to participants and are accessible through:

- <https://emodnet.ec.europa.eu/en/tools-guidelines#biotools>

- <https://emodnet.ec.europa.eu/en/biology#biology-key-services>
- [classroom.oceanteacher.org/enrol/index.php?id=958](https://classroom.oceanteacher.org/enrol/index.php?id=958)

During the workshop several additional information and online resources were provided by the workshop participants and are added below:

- Tutorials on how to work with CF-NetCDF files:
  - in R: [https://nordatanet.github.io/NetCDF in R from beginner to pro](https://nordatanet.github.io/NetCDF_in_R_from_beginner_to_pro)
  - in Python: [https://nordatanet.github.io/NetCDF in Python from beginner to pro](https://nordatanet.github.io/NetCDF_in_Python_from_beginner_to_pro)
  - <https://www.youtube.com/@LukeDataManager>
- Support for metabarcoding Data Programme:
  - <https://www.gbif.org/metabarcoding>
- Resources based on Artificial Intelligence to support dataset standardization:
  - <https://www.gbif.org/news/6aw2VFiEHYlqb48w86uKSf/chatipt-system-wins-the-2024-ebbe-nielsen-challenge>

## 5. Conclusion and way forward

Feedback collected after the event confirmed the importance of stronger interactions between the research community collecting data and the major data infrastructures, such as EMODnet Biology, in order to share information on data management systems, tools and services.

Among the major challenges to be addressed: data curation is a fundamental yet overlooked phase of the scientific process and it should be more clearly accounted for with dedicated resources and expertise. Data curation is currently in place in the case of big data creators/publishers such as Ecotaxa, or big consortia such as Tara Oceans but is not sufficiently tackled by most projects.

This first EMODnet Biology initiative dedicated specifically to EU Mission Ocean research projects allowed to collect needs and requirements in the area of data management and curation. Feedback collected after the event indicated the need for both: general overview of EMODnet Biology tools and services as well as specific data management training, dedicated in particular to early career and researcher-dominated audiences.

The next steps to improve data FAIRness should address three major aspects:

1. a governance aspect which involves dedicating specific funding and capacity building initiatives to support data management and curation;
2. capacity building initiatives to promote the organization of specific hands-on data curation;
3. ICT development to support data management, exploiting the use of Artificial Intelligence to facilitate data management and Quality Control.

Additionally, EMODnet Biology is committed to providing support to these projects by organising further workshops (online or in-person) and data management support via the data management team at VLIZ. Conversions with the European GBIF nodes will also take place and if possible a collaboration between EMODnet Biology and these nodes will be established, to ensure that both initiatives can provide the adequate data management support for the EU Mission Ocean funded projects.

## 6. List of project pitches

# What do we do in EMODnet Biology?

## Overview

- Consortium with 24 partners
- Publish marine biodiversity data
- Create biodiversity data products
- Provide training and create guidelines for data providers and product creators
- Publish informative material
- Support the EU member states, EU institutions and Regional Sea Conventions with their work

# What do we do in EMODnet Biology?

## Data Publication

- Focus on European Seas but we accept data from anywhere in the world's oceans
- Target primarily data from 9 sub-themes

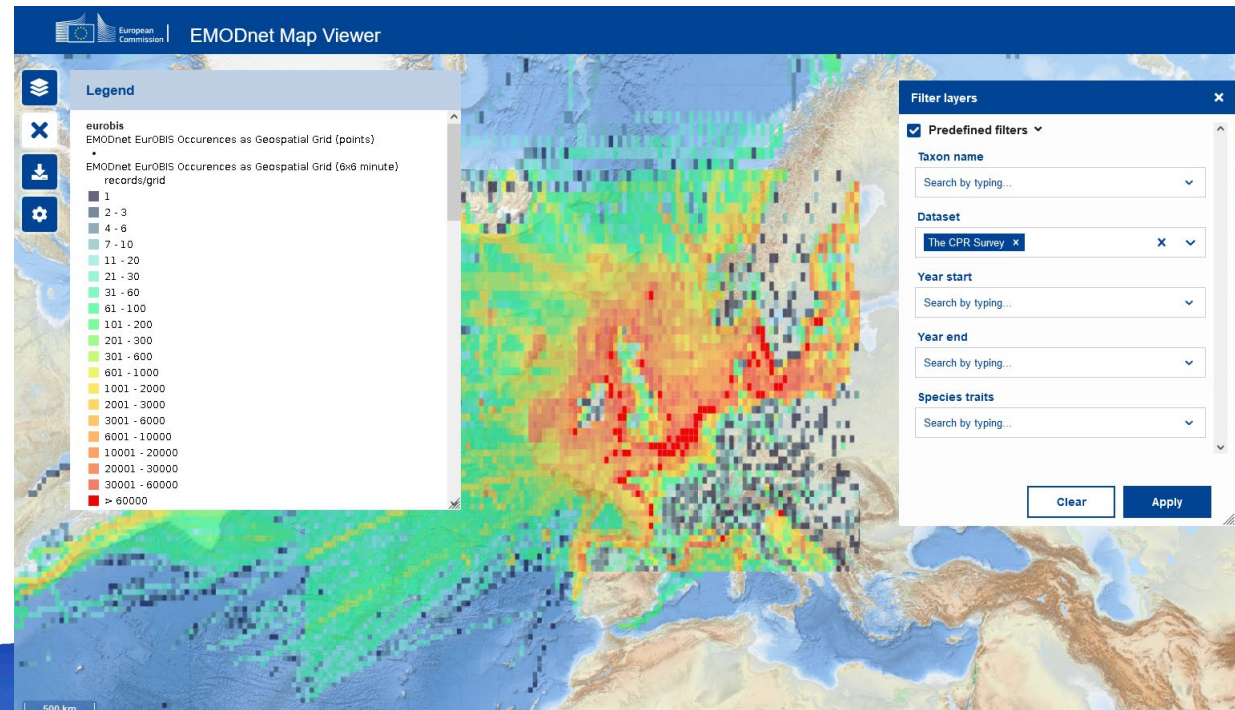

- Data types: Observations, acoustic, tracking, imaging, ... and **genomics**

# What do we do in EMODnet Biology?

## Data Publication

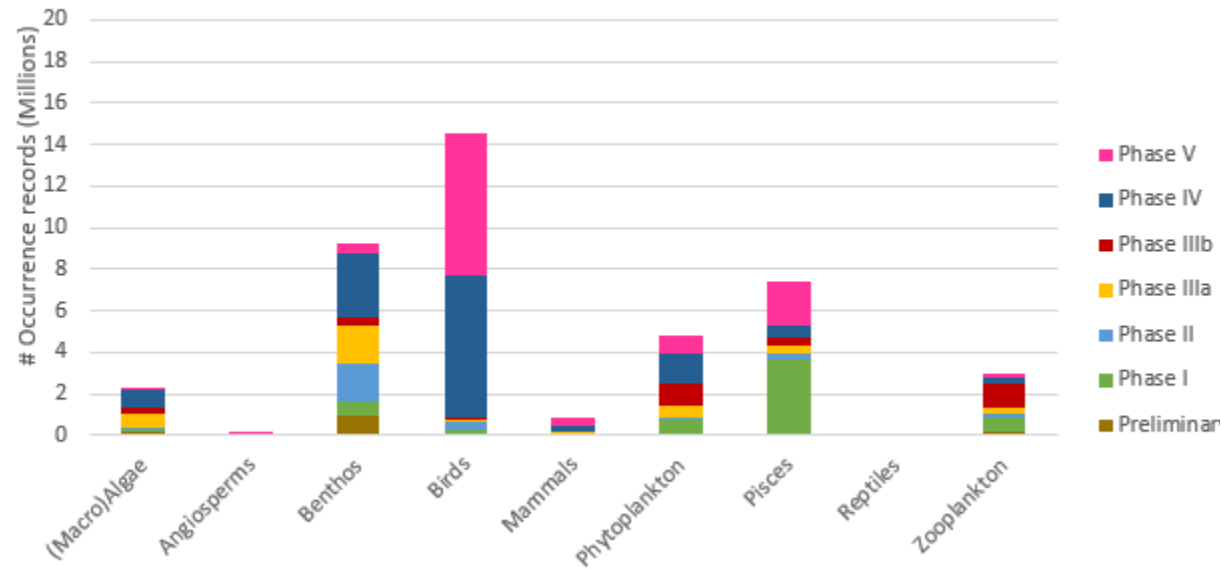

- 1413 datasets with data URLs
- > 41.8M occurrence records + ~ 104M extended Measurements or Facts
- Layer-> [Biodiversity records](#)

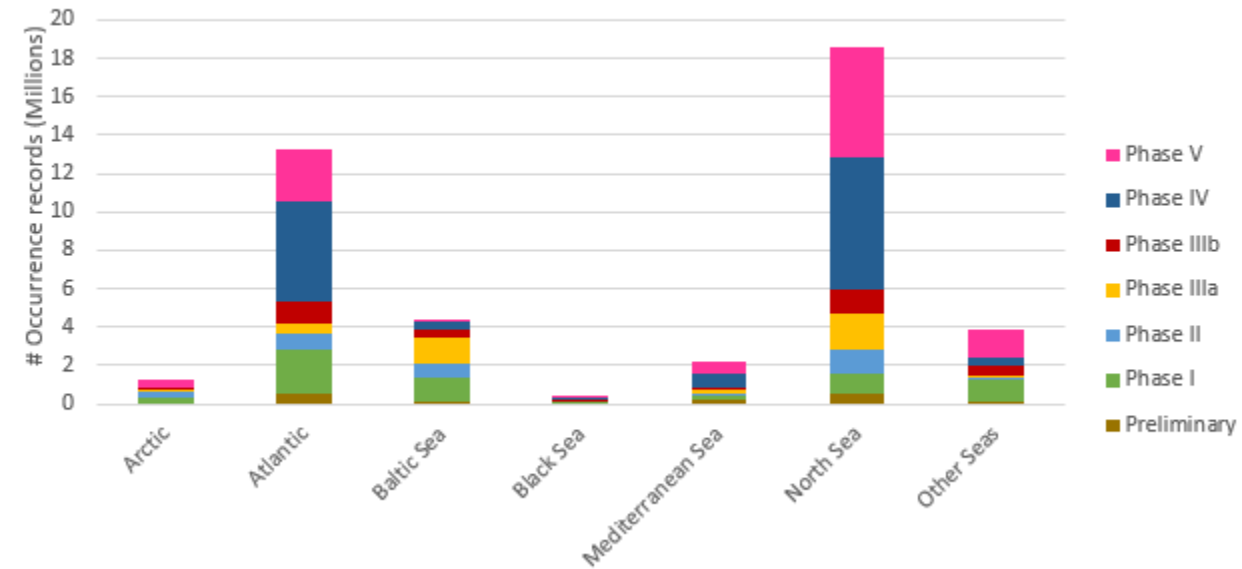

# EMODnet Biology Evolution

## Data Publication

Data increase per sub-theme/per Phase

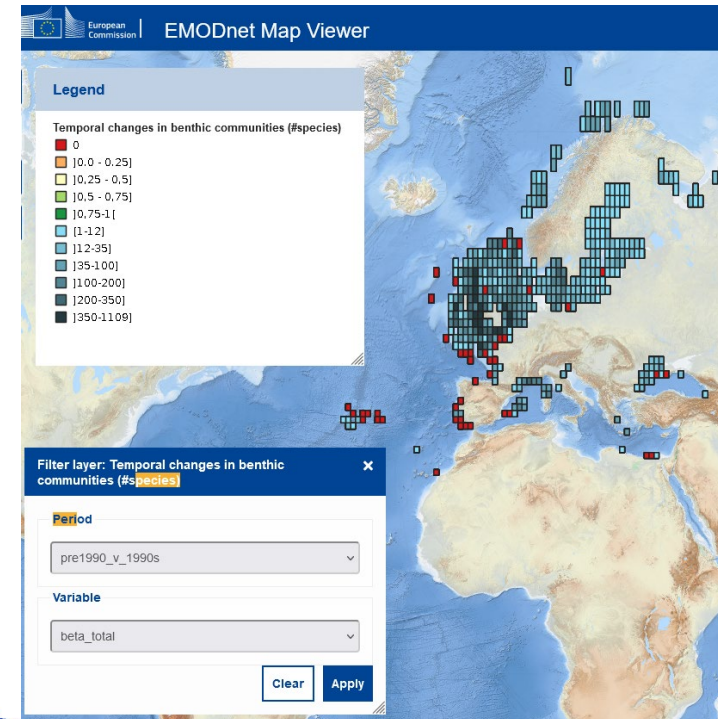

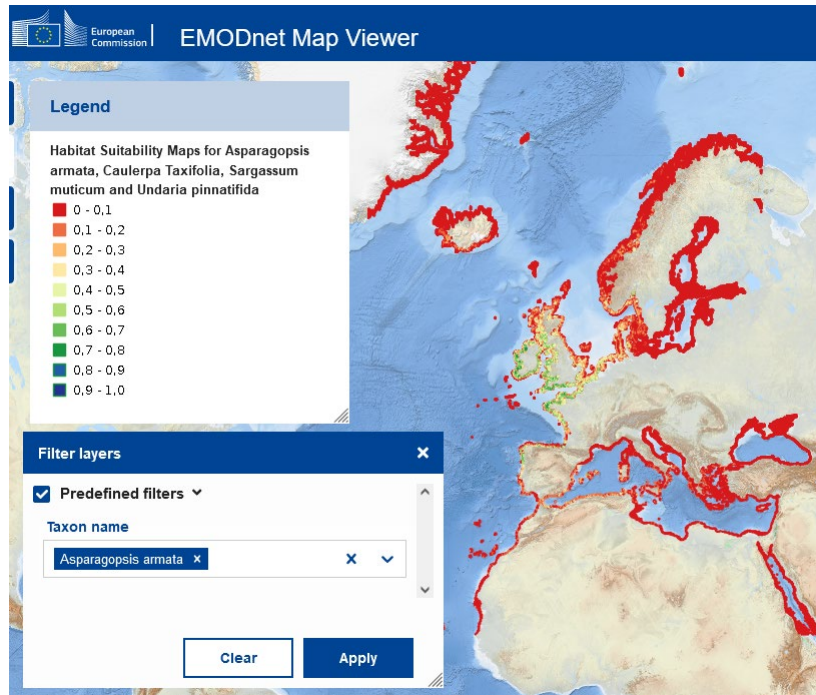

Data increase per region/per Phase

# What do we do in EMODnet Biology?

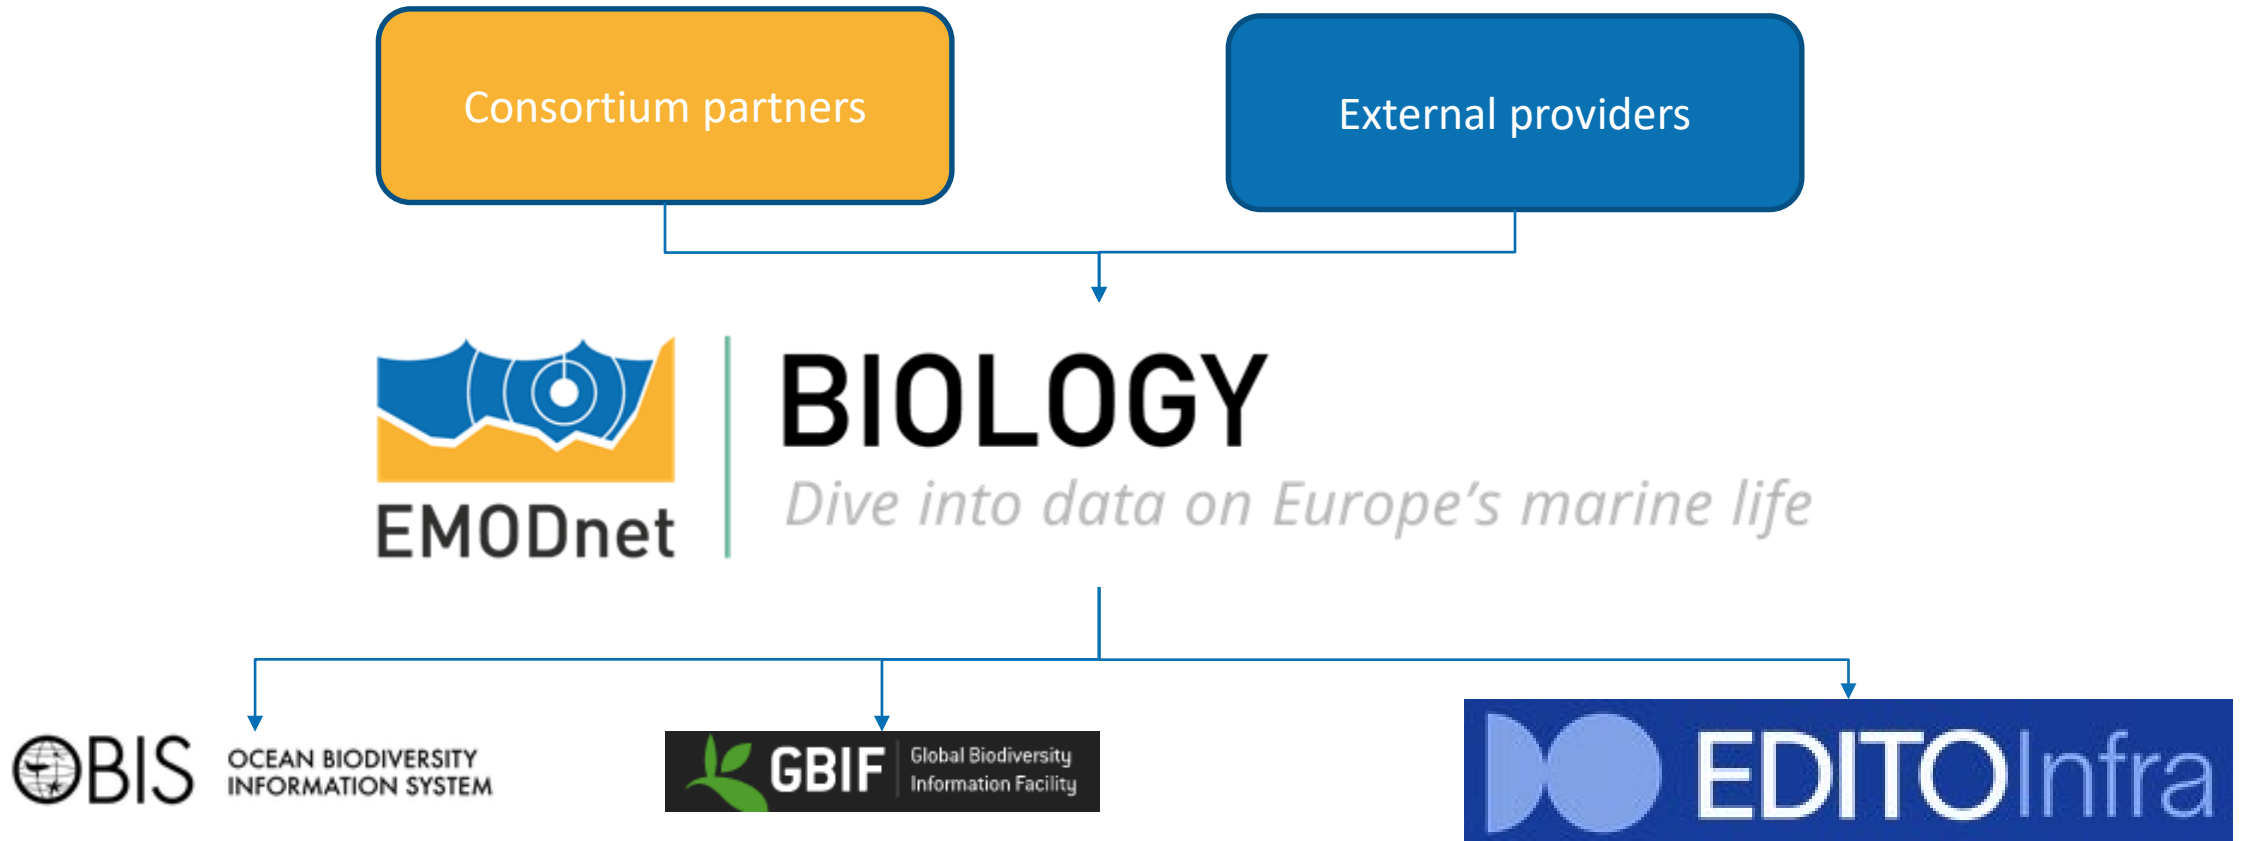

## Data Products

- 38 products (including 3 from external sources)
  - <https://emodnet.ec.europa.eu/geonetwork/srv/eng/catalog.search#/home>
- Layers available in the EMODnet viewer: 3 Benthos+ 5 Fish+ 1 Macroalgae + 2 Mammals + 3 Phytoplankton + 4 Zooplankton + 1 other taxa
- Consortium developed products are documented in GitHub repositories (<https://github.com/EMODnet>)

# Data flows

## Data Submission and Publishing

# What EMODnet Biology will not do for you

- Follow up on your project's Data Management Plans
- Reformat your data to comply with DwC
- Organise and provide training specifically for your project/data providers
- Reformat your products for publication in the EMODnet viewer

# What EMODnet Biology will do

- (Re)publish EU funded project's output (map viewer, catalogue, webservice)
- Publish data (compliant with DwC and QC-ed) that are made available to us
- Ensure your data are shared with other European and international initiatives (OBIS, GBIF, EU DTO)
- Assess which products are relevant for our users and make those visible through the EMODnet viewer
- Publish and maintain resources to be used by the projects (for data and products)
- Continue developing tools and services for data providers and users
- Host and provide technical support for your IPT instance

EMODnet Biology Workshop

19<sup>th</sup> and 20<sup>th</sup> November 2024, Online

The European Marine Observation and Data Network (EMODnet) is financed by the European Union under Regulation (EU) 2021/1139 of the European Parliament and of the Council of 7 July 2021 establishing the European Maritime, Fisheries and Aquaculture Fund.<sup>1</sup>

**Project name:** BlueRemediomics

**Project coordinator:** Rob Finn (EMBL-EBI) and Chris Bowler (CNRS)

**Presented by:** Samuel Chaffron (CNRS)

**Aim of the project:**

Harnessing the Marine Microbiome for Novel Sustainable Biogenics and Ecosystem Services

**Type of biological data collected:** Microbiome sequencing data (metaBGT)

**Geographical area:** Global Ocean

**Data availability, management, connection with EMODnet (access restrictions, standard protocols for data management in place, awareness of standards,...)**

- Freely available public microbiome datasets at MGnify (<https://www.ebi.ac.uk/metagenomics/>)
- Data available via website or JSON:API at <https://www.ebi.ac.uk/metagenomics/api/v1/>

### **Any other information**

- On-going global ocean presence/absence and abundance profiling of marine genomes
- Submission to EMODnet as netCDF ?

Project name:

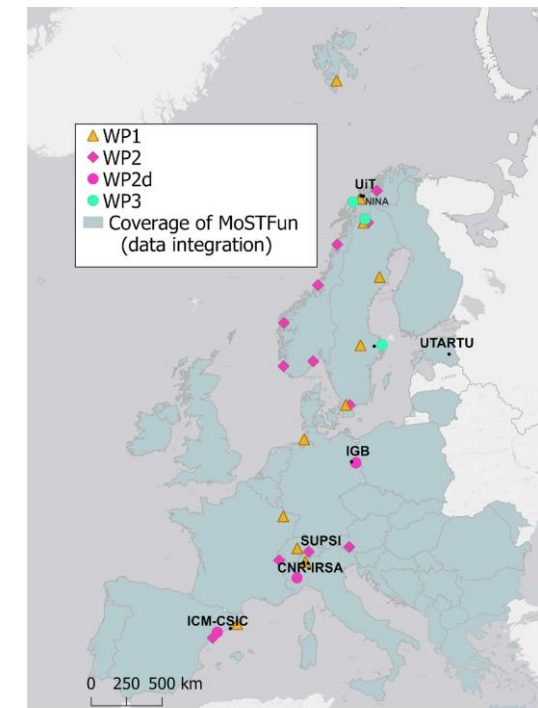

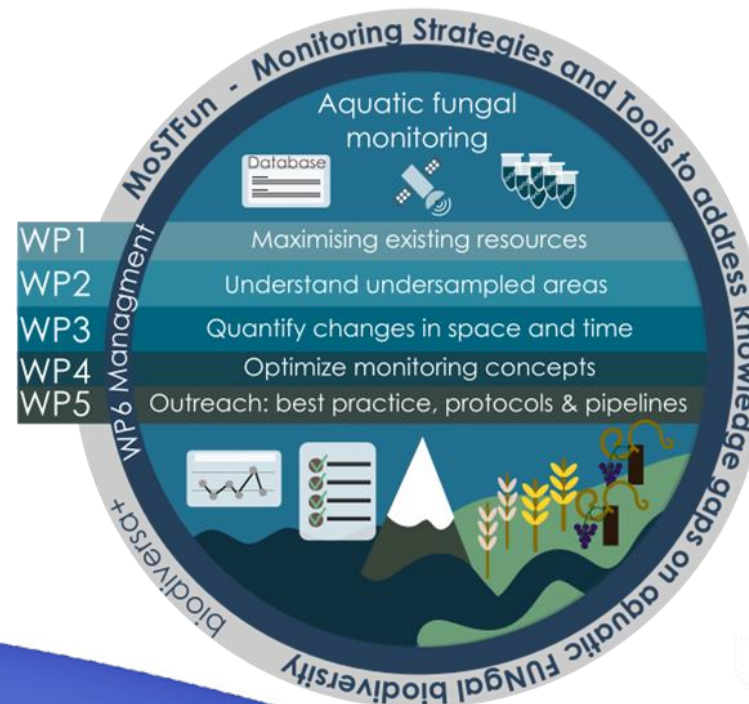

Project coordinator: **Andreas Bruder** SUPSI University of Applied Sciences and Arts of Southern Switzerland (CH)

Presented by: **Laura Garzoli** CNR-IRSA National Research Council, Water Research Institute of (IT)

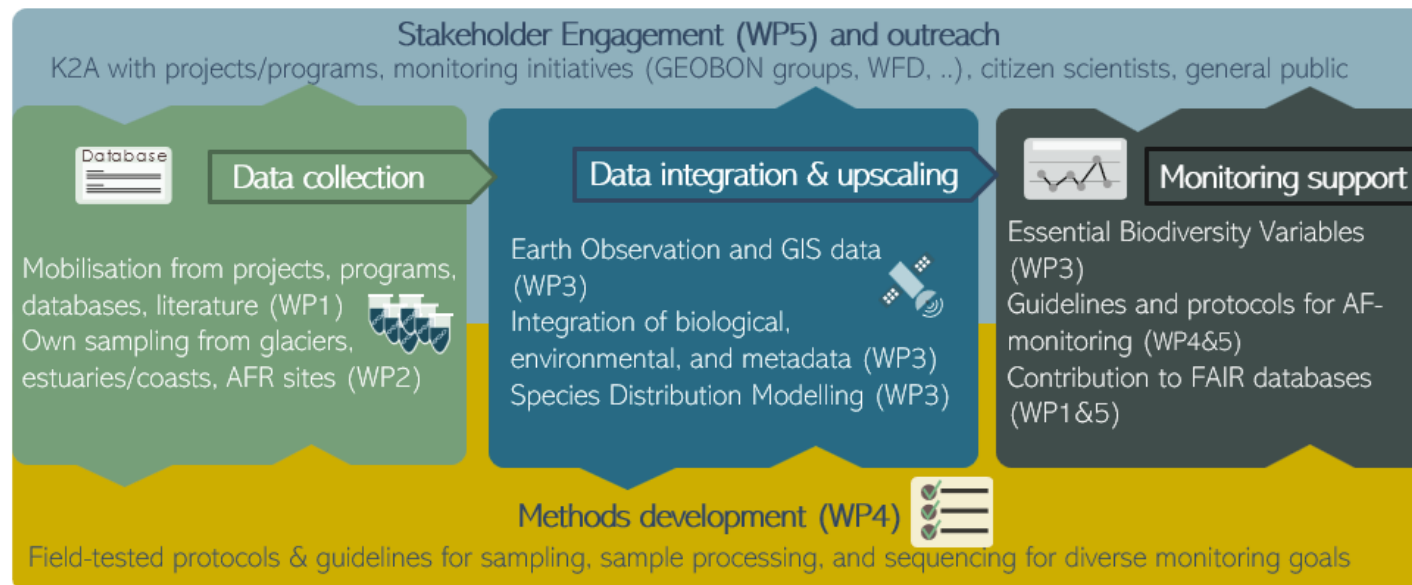

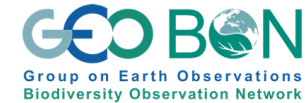

Aim of the project:

Type of biological data collected:  
Water, Sediment, Leaves

Geographical area: EU

# Data availability, management, connection with EMODnet (access restrictions, standard protocols for data management in place, awareness of standards,...)

## Essential Biodiversity Variables (EBVs):

-  Genetic composition
-  Species populations
-  Species traits
-  Community composition
-  Ecosystem function
-  Ecosystem structure

Why it is important

“Data is a **precious** thing and will last longer than the systems themselves.”

# Order, chaos or organized chaos?

# RDM

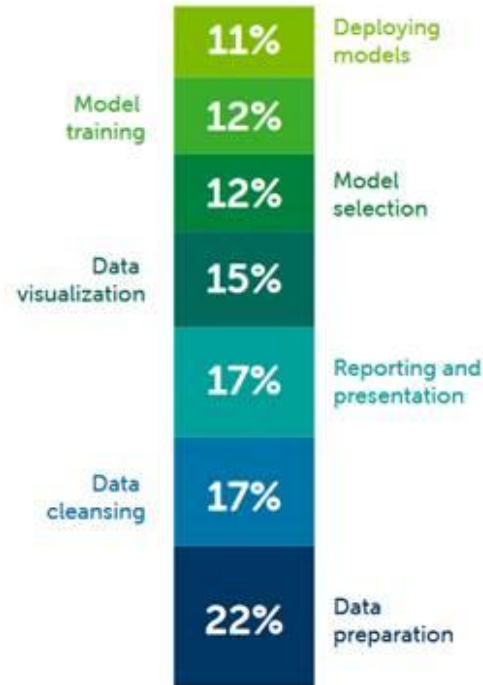

## Why it is important

“We are all data providers and data users”

under the current system. Students in PhD programmes spend up to 80% of their time on ‘data munging’, fixing formatting and minor mistakes to make data suitable for analysis – wasting time and talent. With 400 such students, that would amount to a monetary waste equivalent to the salaries of 200 full-time employees, at minimum. So, hiring 20 professional data stewards to cut time lost to data wrangling would boost effective research capacity. Many top

n = 2,030

We asked our respondents how much time they spend on each of the above tasks, and for each item, enter a number representing the percentage of time spent on each task relative to the other tasks on this list. The percentage values had to add up to 100.

More than 70% of researchers have tried and failed to reproduce another scientist's experiments, and more than half have failed to reproduce their own experiments. Those are some of the telling figures that emerged from *Nature's* survey of 1,576 researchers who took a brief online questionnaire on reproducibility in research.

How is your data analysis going?

Can't understand the data

... and the data collector does not answer my emails or my phone calls

That is terrible and so cruel !  
Who is it, who collected the data ?

I did... 3 years ago

Your first collaborators are your future selves, be nice to them !

your future self, by Julien Colomb, CC-BY-NC, derived from .NORM Normal File Format, CC-BY-NC, by Randall Munroe

## Personal benefits

**Work more efficient & organised**

**More references & credits to your work**

Career recognition

Collaborations

## Moral obligations

**Efficient use of public resources**

Data are unique & come with a high cost

**Facilitates data finding & re-use**

🔍 New research & new insights

**Better data leads to better research**

🔍 Improved decisions-making

🔍 Increased transparency & trust in science

# RDM

Why it is

## Example Marine Sciences

- Biomass

Identifier ↑	Preferred label ↑	Alternative label ↑	Definition ↑
SDBIOL09	Dry weight biomass of biological entity specified elsewhere per unit volume of the water body	WaterDryWtBiom_BE007117	The mass measured after drying at elevated temperatures until a stable mass is reached, of an identified biological object described elsewhere in the metadata occurring in a given volume of any body of salt or fresh water.
SDBIOL07	Ash-free dry weight biomass of biological entity specified elsewhere per unit volume of the water body	WaterAshFreeBiom_BE007117	The mass lost on ignition of an identified biological object described elsewhere in the metadata occurring in a given volume of any body of salt or fresh water.
SDBIOL04	Wet weight biomass of biological entity specified elsewhere per unit volume of the water body	WaterWetWtBiom	The mass as caught of an identified biological object described elsewhere in the metadata occurring in a given volume of any body of salt or fresh water.
SDBIOL12	Biomass as carbon of biological entity specified elsewhere per unit volume of the water body by computation	WaterCarbonBiomassConv	The carbon biomass, calculated from the cell counts using literature conversion factors, of an unspecified biological entity in a given volume of any body of salt or fresh water.

Notes: Images are available upon request via LifeWatch Belgium ([info@lifewatch.be](mailto:info@lifewatch.be))

### Description

In the framework of the Lifewatch marine observatory a number of fixed stations on the Belgian Part of the North Sea (BPNS) are visited on a monthly or seasonal basis using the RV Simon Stevin. A grid of nine stations covers the coastal zone and are sampled monthly. Eight additional stations, located further at sea, are sampled on a seasonal basis. This dataset contains zooplankton observations in the Belgian Part of the North Sea (BPNS) since 2012. Zooplankton is sampled by vertical WP2 net tows, samples scanned with ZooScanner and identification with plankton analyser software, followed by manual validation.

# EMODnet Seabed Habitats

## Catalogue and products

The screenshot displays the EMODnet Seabed Habitats products catalogue interface. At the top, there is a search bar with the text "Search ...". Below the search bar, a navigation bar shows "1 - 20 on 1530" and "Sorted by popularity". On the left side, there is a filter panel with a "Filter" button and a list of filter categories: TYPE OF RESOURCES, AVAILABLE ACTIONS, TOPICS, KEYWORDS, CONTACT FOR THE RESOURCE, and PROVIDED BY. The "PROVIDED BY" category is expanded, showing "EMODnet Seabed Habitats (1530)". The main content area displays four product cards. The first card is titled "EUSeaMap 2023 Broad-Scale Predictive Habitat Map for Europe" and describes the output of the 2023 EUSeaMap broad-scale predictive model. The second card is titled "EMODnet Seabed Habitats collated habitat maps" and describes data holdings of polygonal habitat maps in European waters. The third card is titled "Seagrass cover (Essential Ocean Variable) in European waters (2023)" and describes the current known extent and distribution of Seagrass meadows. The fourth card is also titled "EMODnet Seabed Habitats collated habitat maps" and describes data holdings of individual habitat maps in European waters. Each card includes a brief description and a "Categories" link.

Biology

# Project pitches - Part 2

**CONTRAST**

**B-USEFUL**

**MARHAB**

EMODnet Biology Workshop

19<sup>th</sup> and 20<sup>th</sup> November 2024, Online

The European Marine Observation and Data Network (EMODnet) is financed by the European Union under Regulation (EU) 2021/1139 of the European Parliament and of the Council of 7 July 2021 establishing the European Maritime, Fisheries and Aquaculture Fund.<sup>1</sup>

**Project name: CONTRAST**

**Project coordinator: Steven Brooks (NIVA)**

**Presented by: Steven Brooks**

**Aim of the project: To investigate the impacts of chemicals of emerging concern on the marine environment**

**Type of biological data collected: Biological effects data, biodiversity in sediments and water column**

**Geographical area: North Sea, North-East Atlantic, Mediterranean Sea**

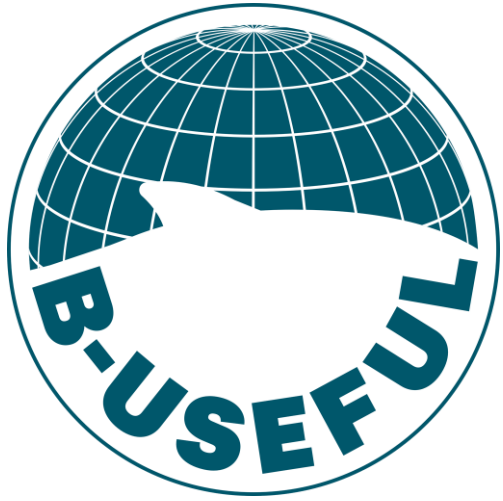

# Data availability, management, connection with EMODnet (access restrictions, standard protocols for data management in place, awareness of standards,...)

- Data management plan in place
- FAIR principles\*
- Standards in place, include the use of common vocabularies to code, for example, keywords, data disciplines and measured parameters.

Main deliverable type: Data (data sets, microdata)		
Type of data	Characteristics	Possible formats
Chemical and physicochemical data	Concentration of CECs and legacy contaminants in different matrices, physicochemical properties such as temperature, salinity, oxygen, suspended particle matter (SPM), dissolved organic matter (DOM)	Recommended: .csv or .tab Accepted: .xls or .xlsx
Biological Data	Information regarding living organisms, encompassing genomics (other omics data), physiological parameters, and other related aspects, e.g. field, lab, mesocosm.  Biological effects data and biodiversity (eDNA, proteomics, visual ID data)	Recommended: .csv or .tab Accepted: .xls or .xlsx
Computational Data	Data produced by computer simulations, modelling, algorithms, or software applications, e.g., model outputs	Recommended: NetCDF

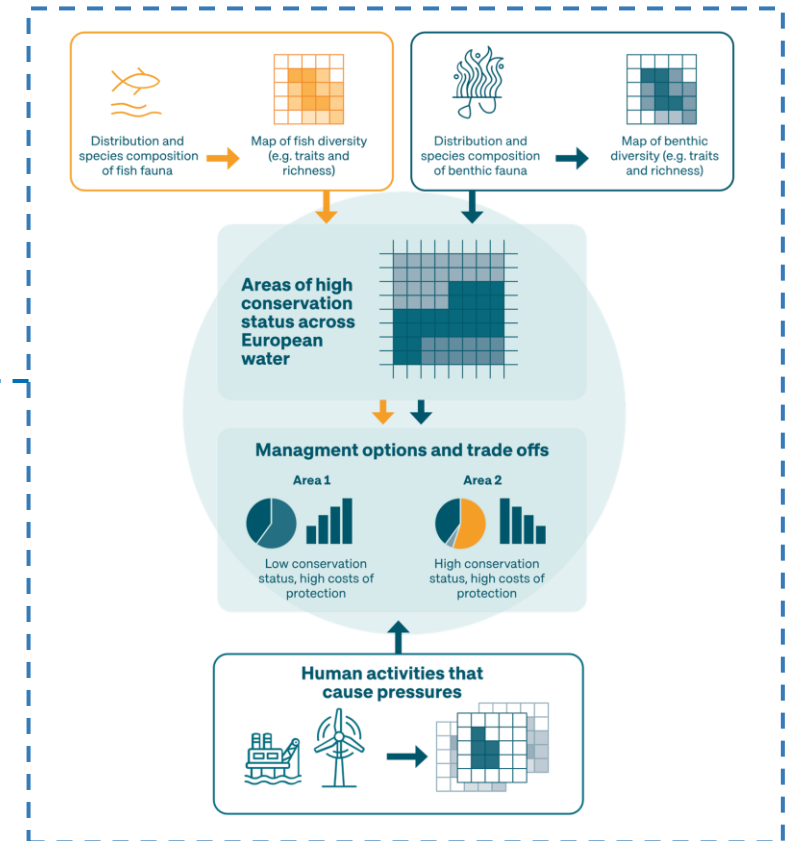

\* To ensure harmonised data management, guidelines and templates for structuring data and metadata will be provided throughout the CONTRAST project. These resources will enhance the findability, accessibility, interoperability, and reusability of the data, in alignment with FAIR

## Any other information

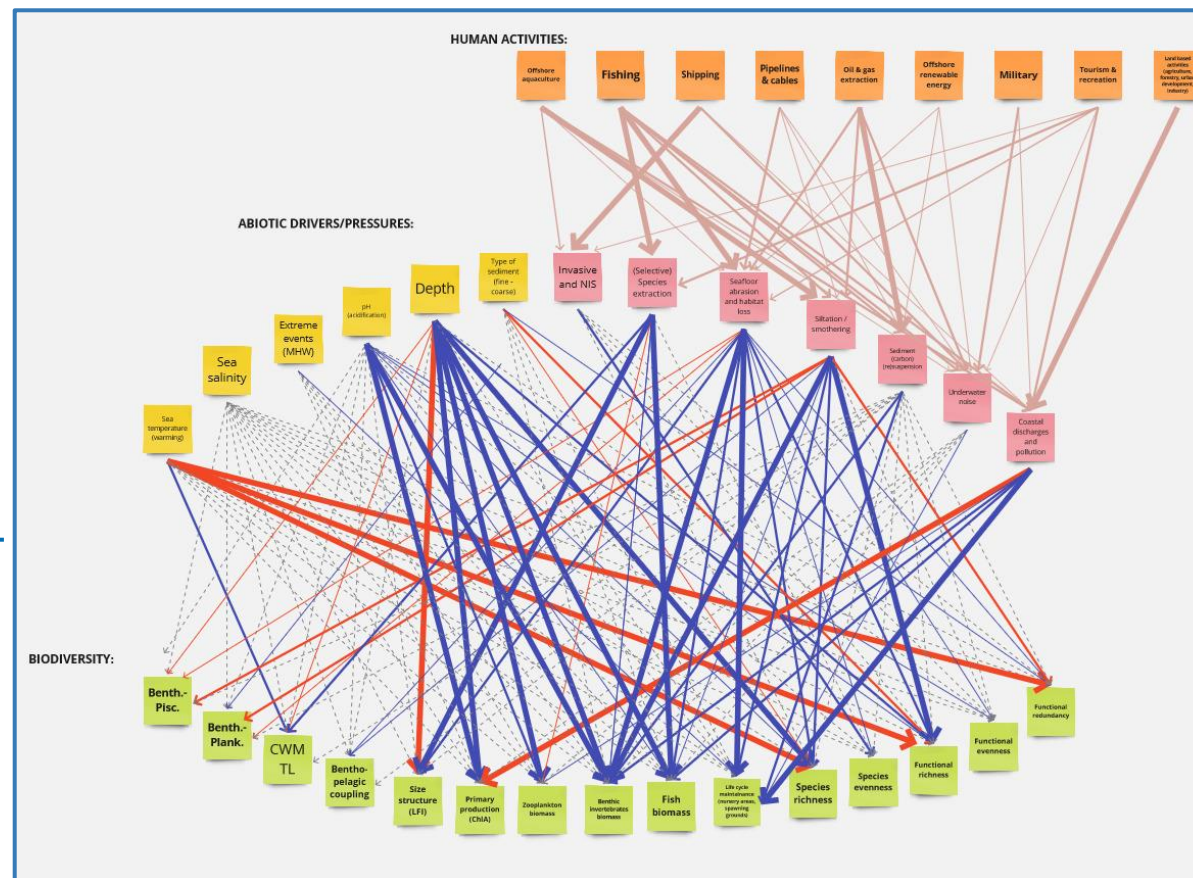

- **COORDINATED BY** Technical University of Denmark (DTU, Martin Lindegren).
- **AIM OF THE PROJECT:** Operationalize **biodiversity** and **ecosystem services** indicators through end-users co-developed decision-support tool.
- **TYPE OF BIOLOGICAL DATA COLLECTED:** benthic, demersal and pelagic fish and invertebrate communities' data.

**FOR EUROPEAN REGIONAL SEAS (Mediterranean, NE Atlantic, Barents and Norwegian seas, North sea) IDENTIFY AREAS OF PARTICULAR INTEREST IN TERMS OF BIODIVERSITY AND ECOSYSTEM SERVICES AND PROVIDE USEFUL TOOLS FOR CONSERVATION AND MANAGEMENT.**

# CONNECTION TO EMODnet:

- At project level, use and generation of data: climatological, biological, etc
- At WP level: Links Between Ecosystem Services, Biodiversity And Pressures.

**Project name: Improving marine habitat status by considering ecosystem dynamics (MARHAB)**

**Project coordinator: Institute of Marine Research, Norway**

**Presented by: Even Moland (coordinator)**

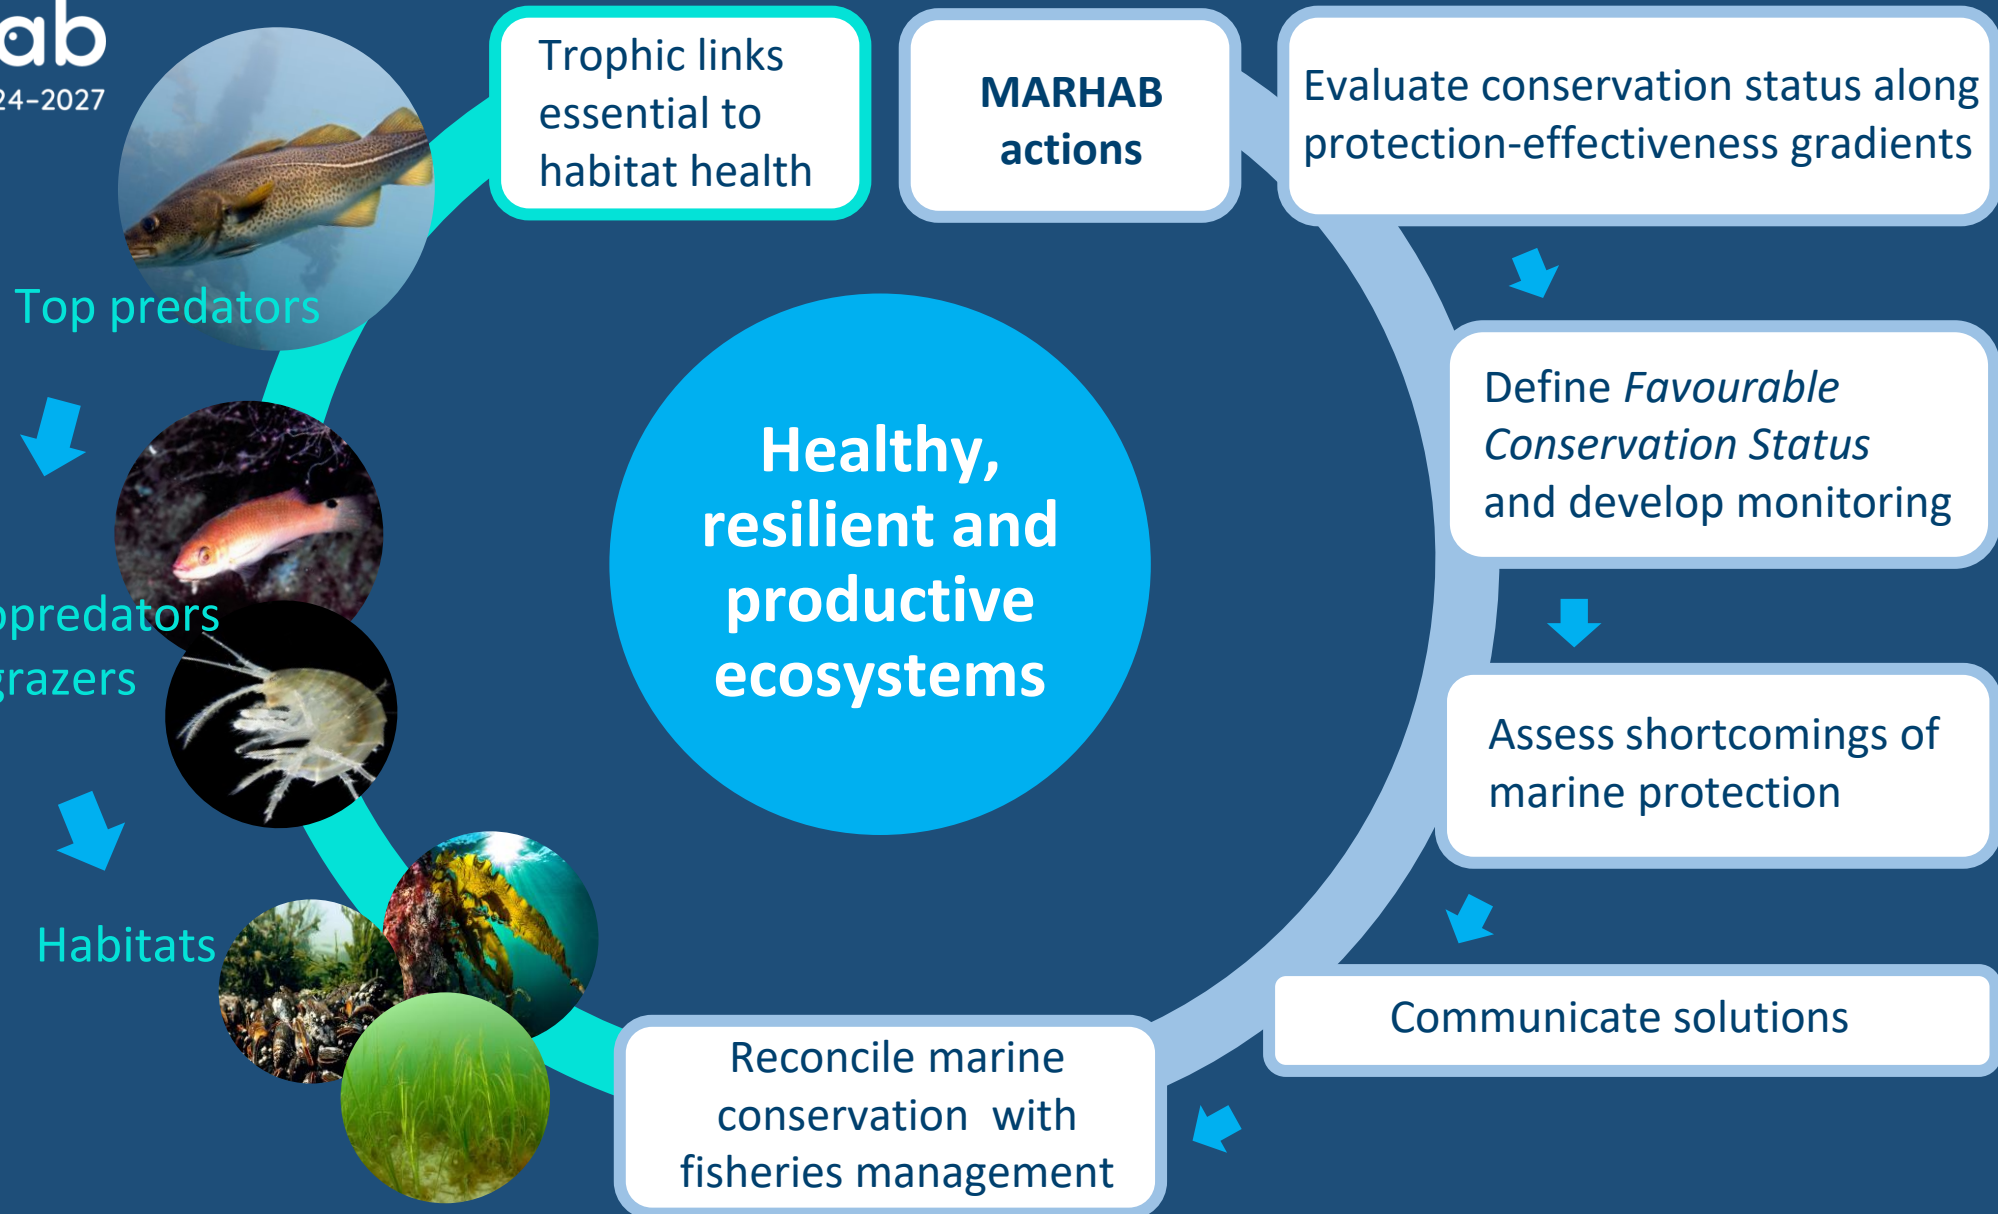

**Type of biological data collected: Coastal fish assemblages (BRUVs), marine animal movement (acoustic telemetry, satellite telemetry), genetics, function (predator presence and size structure)**

**Geographical area: Skagerrak and Kattegat**

**MarHab**  
Horizon Europe 2024-2027

**Data availability, management, connection with EMODnet (access restrictions, standard protocols for data management in place, awareness of standards):**

**All data will be shared and made available according to the project DMP. Telemetry data will be shared with European tracking network.**

**Any other information: Follow MARHAB project on LinkedIn and visit [marhab.eu](https://marhab.eu)**

## **GES4SEAS**

## **Biodiversity Meets Data - BMD**

## **PROTECT BALTIC**

## **DIGI4ECO**

EMODnet Biology Workshop  
19<sup>th</sup> and 20<sup>th</sup> November 2024, Online

The European Marine Observation and Data Network (EMODnet) is financed by the European Union under Regulation (EU) 2021/1139 of the European Parliament and of the Council of 7 July 2021 establishing the European Maritime, Fisheries and Aquaculture Fund.<sup>1</sup>

**Project name:** Achieving **Good Environmental Status** for maintaining ecosystem **services**, by **assessing** integrated impacts of cumulative pressures (GES4SEAS) [www.ges4seas.eu](http://www.ges4seas.eu) 2022-2026

**Project coordinator:** Angel Borja (AZTI)

**Aim of the project:** Guide marine governance processes on minimizing **human pressures** and their impacts on coastal and **marine biodiversity** and ecosystem functioning, while maintaining the **sustainable delivery of ecosystem services**, through the development of an innovative **toolbox**, tested, validated and demonstrated, in the context of an adaptive **ecosystem-based management**

**Type of biological data collected:** No new data collected, but data on human activities, pressures and ecosystem components collated from open data sources and the 20 partners, and presented as GIS layers, plus additional data from local monitoring

**Geographical area:** From 11 Learnings Sites: 9 covering the 4 regional seas, 1 in French Polynesia and 1 in whole Europe

# Data availability, management, connection with EMODnet (access restrictions, standard protocols for data management in place, awareness of standards,...)

- Look at the updated data management plan (Deliverable 5.5):  
<https://www.ges4seas.eu/resources/#2024>
- Data will be available in supplementary material of papers, and in our Zenodo repository:  
<https://zenodo.org/communities/ges4seas/records?q=&l=list&p=1&s=10&sort=newest>

## Any other information:

- Borja, A., 2023. A dataset and template for assessing the ecological status of marine sediments and waters, based on microbial taxa. Gigabyte, 2023: 10.46471/gigabyte.46486. A list of 1,974 microbial taxa with ecological groups to assess the status
- <https://ambi.azti.es> A list of 11,950 taxa with ecological groups to assess benthic status. Provided to WoRMs
- Borja et al., submitted. Marine Biodiversity and Environmental Data: An AI-Ready, Open Dataset from the long term (1995–2023) Basque Country Monitoring Network. *Frontiers in Ocean Sustainability*. Includes water, sediment, biota, phytoplankton, macroalgae, macroinvertebrates and fish from estuaries and coasts

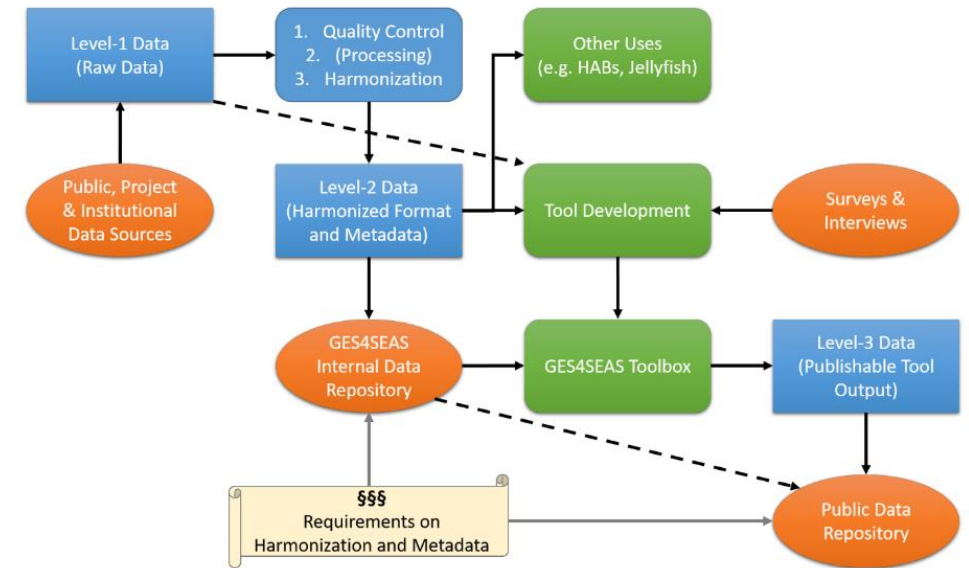

Figure 1. Schematic illustration of data-flow (black arrows) within the GES4SEAS project. Dashed arrows symbolize partial data-flows. HABs: Harmful Algal Blooms.

**Project name:**

**Project coordinator:** Niels Raes

**Presented by:** Niels Raes

**Aim of the project:** Develop a Single Access Point to biodiversity data and analyses tools for managers of natural resources and policy makers across Europe

**Type of biological data collected:** eDNA / High-throughput biodiversity monitoring data

**Geographical area:** Europe/Global

Niels Raes –

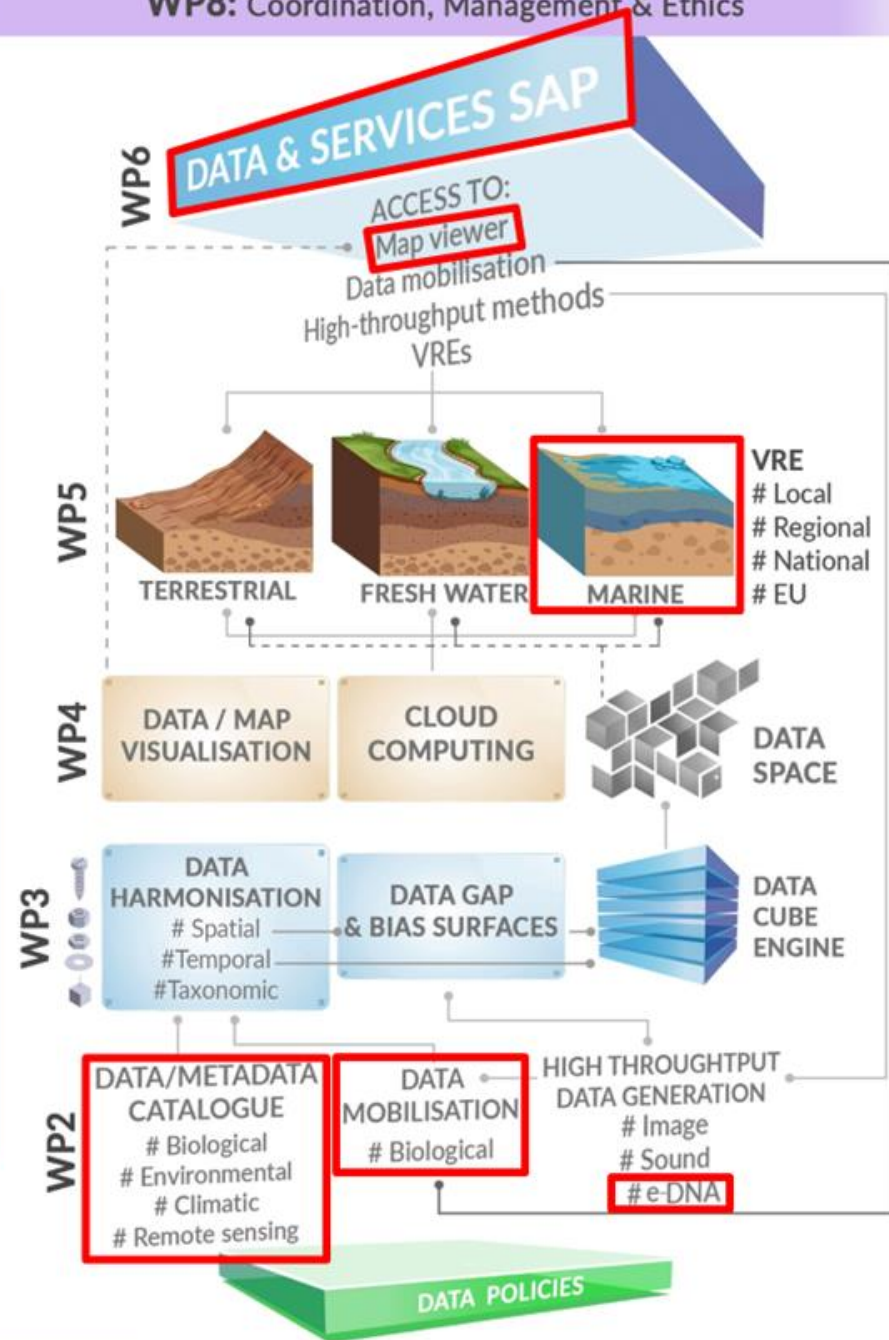

niels.raes@naturalis.nl

BMD is a **Single Access Point (SAP)** that provides managers of natural resources and policy makers with access to:

- **High-throughput biodiversity monitoring** tools including image and sound capture, and e-DNA sampling combined with **AI taxon identification services**;
- A suite of co-designed **Virtual Research Environments (VREs)** for the **terrestrial**, **freshwater** and **marine** realms, including tools for:
  - a) **biodiversity monitoring**,
  - b) identification and analysis of **drivers of change**, and
  - c) projections of **land cover and climate change** on the distribution of species and habitats.
- **Web-GIS Map viewer** to explore the data and VRE results.
- Stakeholder/user engagement & user needs mapping at all stages of the SAP development (WP1).
- **Start March 2025.**

WP1: Stakeholder/user engagement & user needs mapping

WP8: Coordination, Management & Ethics

WP7: Communication, Dissemination & Training

**Project name:** PROTECT BALTIC (Enabling comprehensive effective and efficient protection and restoration measures for a resilient Baltic Sea ecosystem)

**Project coordinator:** HELCOM (Baltic Marine Environment Protection Commission)

**Presented by:** Kimmo Koivumäki, PROTECT data manager, HELCOM

**Aim of the project:** To enable sufficient spatial protection and restoration of the marine environment to secure positive biodiversity outcomes, ensuring that the function of the ecosystem is maintained, thus securing production of ecosystems services and enabling sustainable use both short and long term.

**Type of biological data collected:** Species observations, species distribution models (benthic species, birds, fish, decapod crustaceans), sedimentation, turbidity

**Geographical area:** Baltic Sea and its surrounding countries

## Data availability

- Majority of the data is open. Restricted data can be used for modelling and/or analysis.
- Spatial data mainly published in [HELCOM MADS](#) and [biodiversity database](#), metadata in [Metadata catalogue](#)

## Data management

- Data Management Plan defines used processes.
- Data is stored in Microsoft SharePoint with limited access for project staff. Original datasets are in HELCOM's internal drive which is restricted for secretariat's data personnel.

## Data connection with EMODnet

- There are three datasets collected from EMODnet:
  - *Sedimentation accumulation rate*
  - *Sediment maps*
  - Total suspended matter used as a proxy for *turbidity*

# Digital Twin-sustained 4D ecological monitoring of restoration in fishery depleted areas (DIGI4ECO)

**Project Pitches**  
EMODNet Biology Workshop  
November 20<sup>th</sup>, 2024

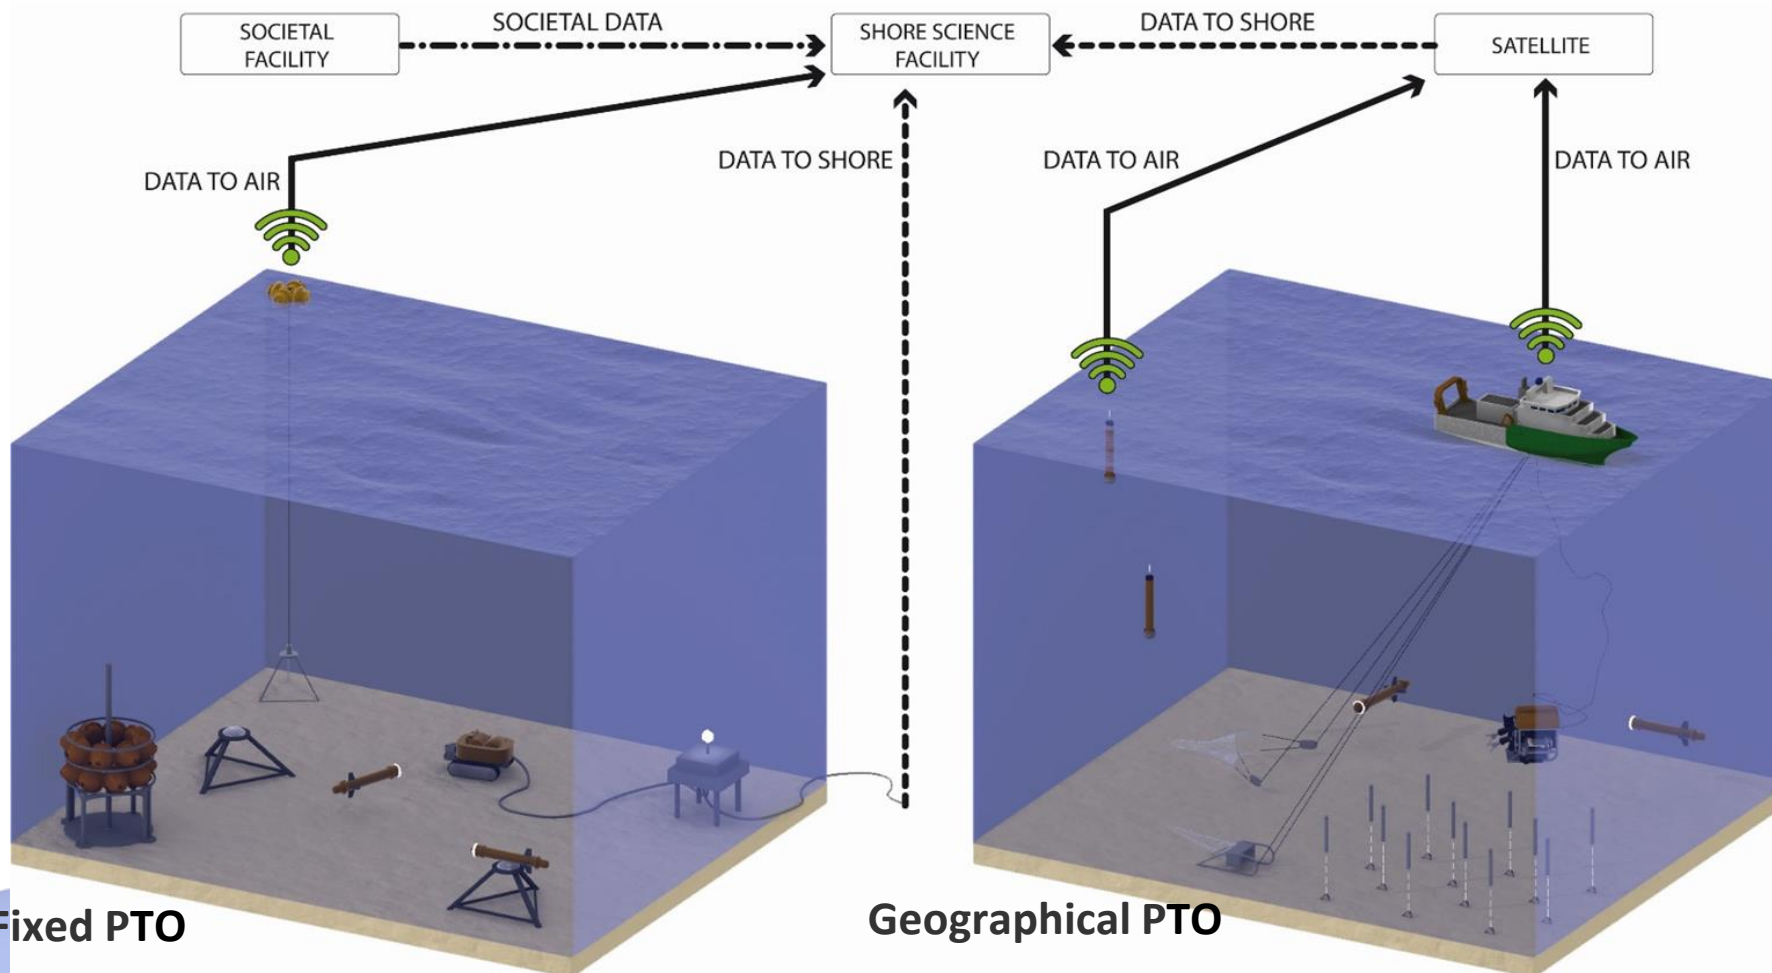

**Drs J. Aguzzi (ICM-CSIC) & M. Clavel-Henry (GEOMAR)**

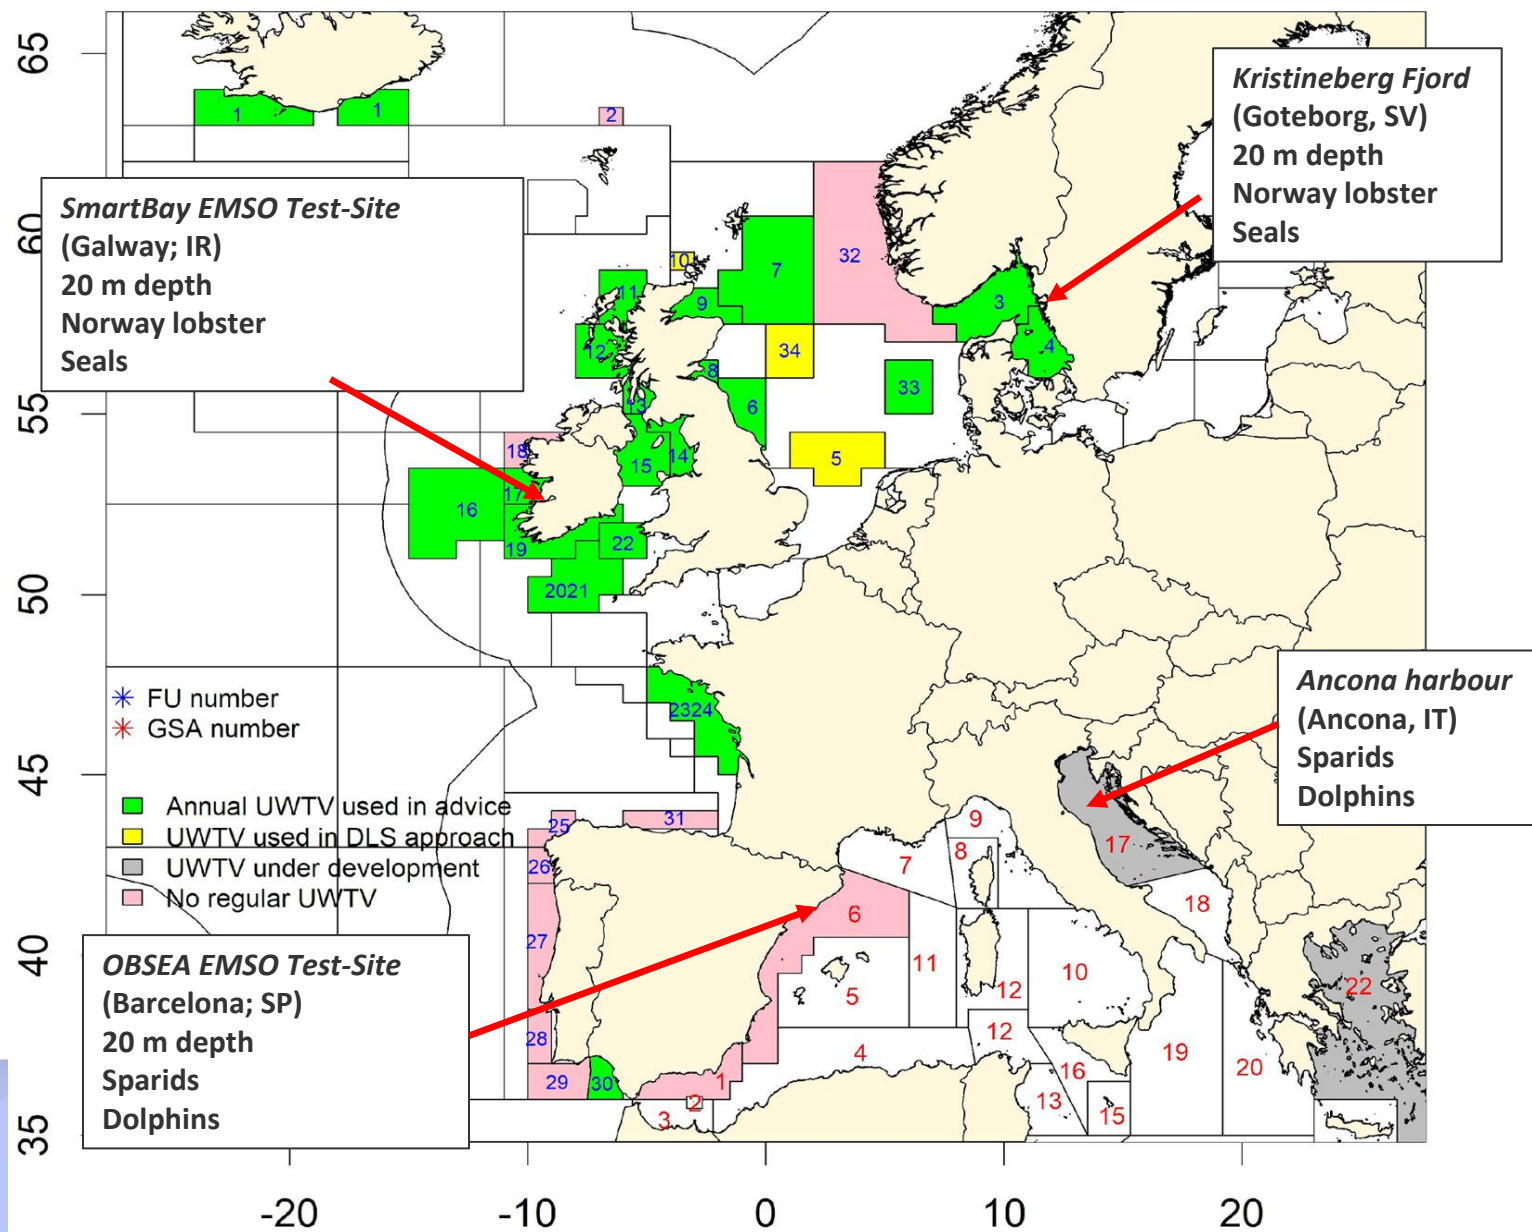

- M1** ● Digital Twin of Ocean (DTO) **simulates marine biological and environmental components** to understand ecosystems' past and present state and make predictions about their future
- M2** ● In spite of the vastness of marine ecosystems, any approach to management requires the definition of **strategic areas** where to **repeat** measurements
- M3** ● Therefore, DTO need to identify this space and include in its virtualization, the tools for in-situ data collection
- Obj.** ● Implement robotic networks for **demo-missions** delivering real-time data to be **merged with historical and sleeping data**, allowing comparisons for spatial scaling and temporal modelling

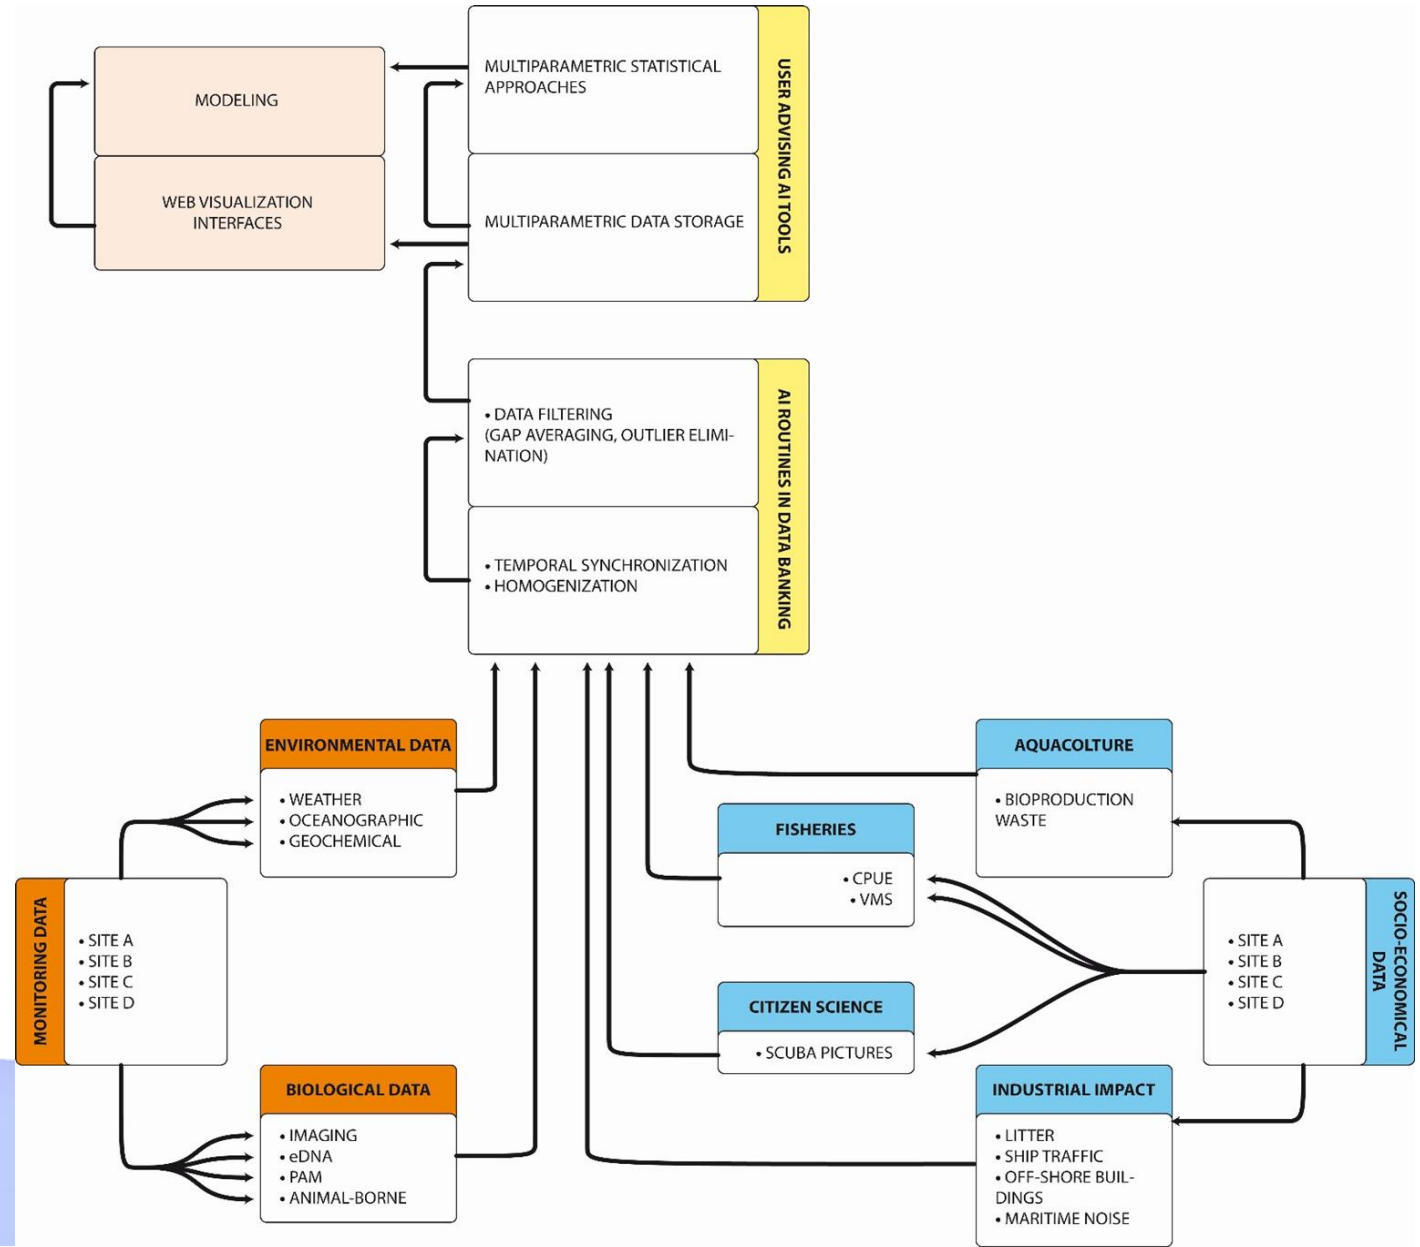

# Physical Twin of Ocean (PTO)

A PTO describes the physical system that allows the multiparametric data collection in the real-world

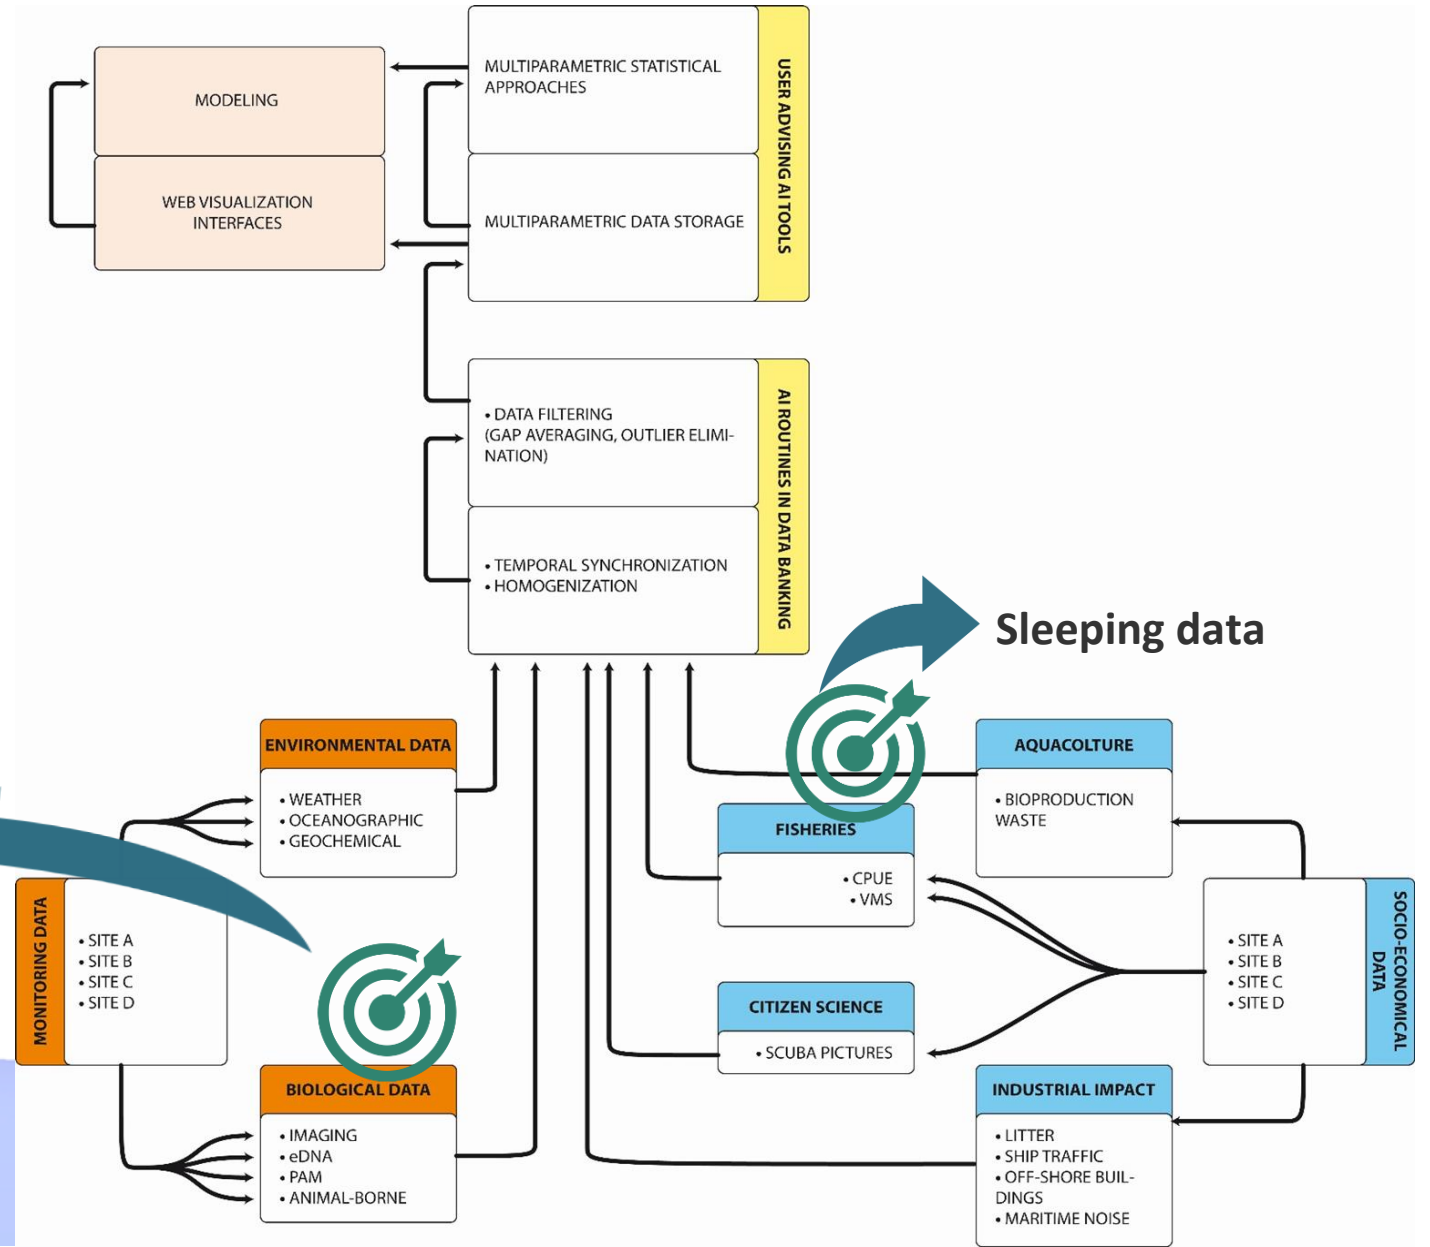

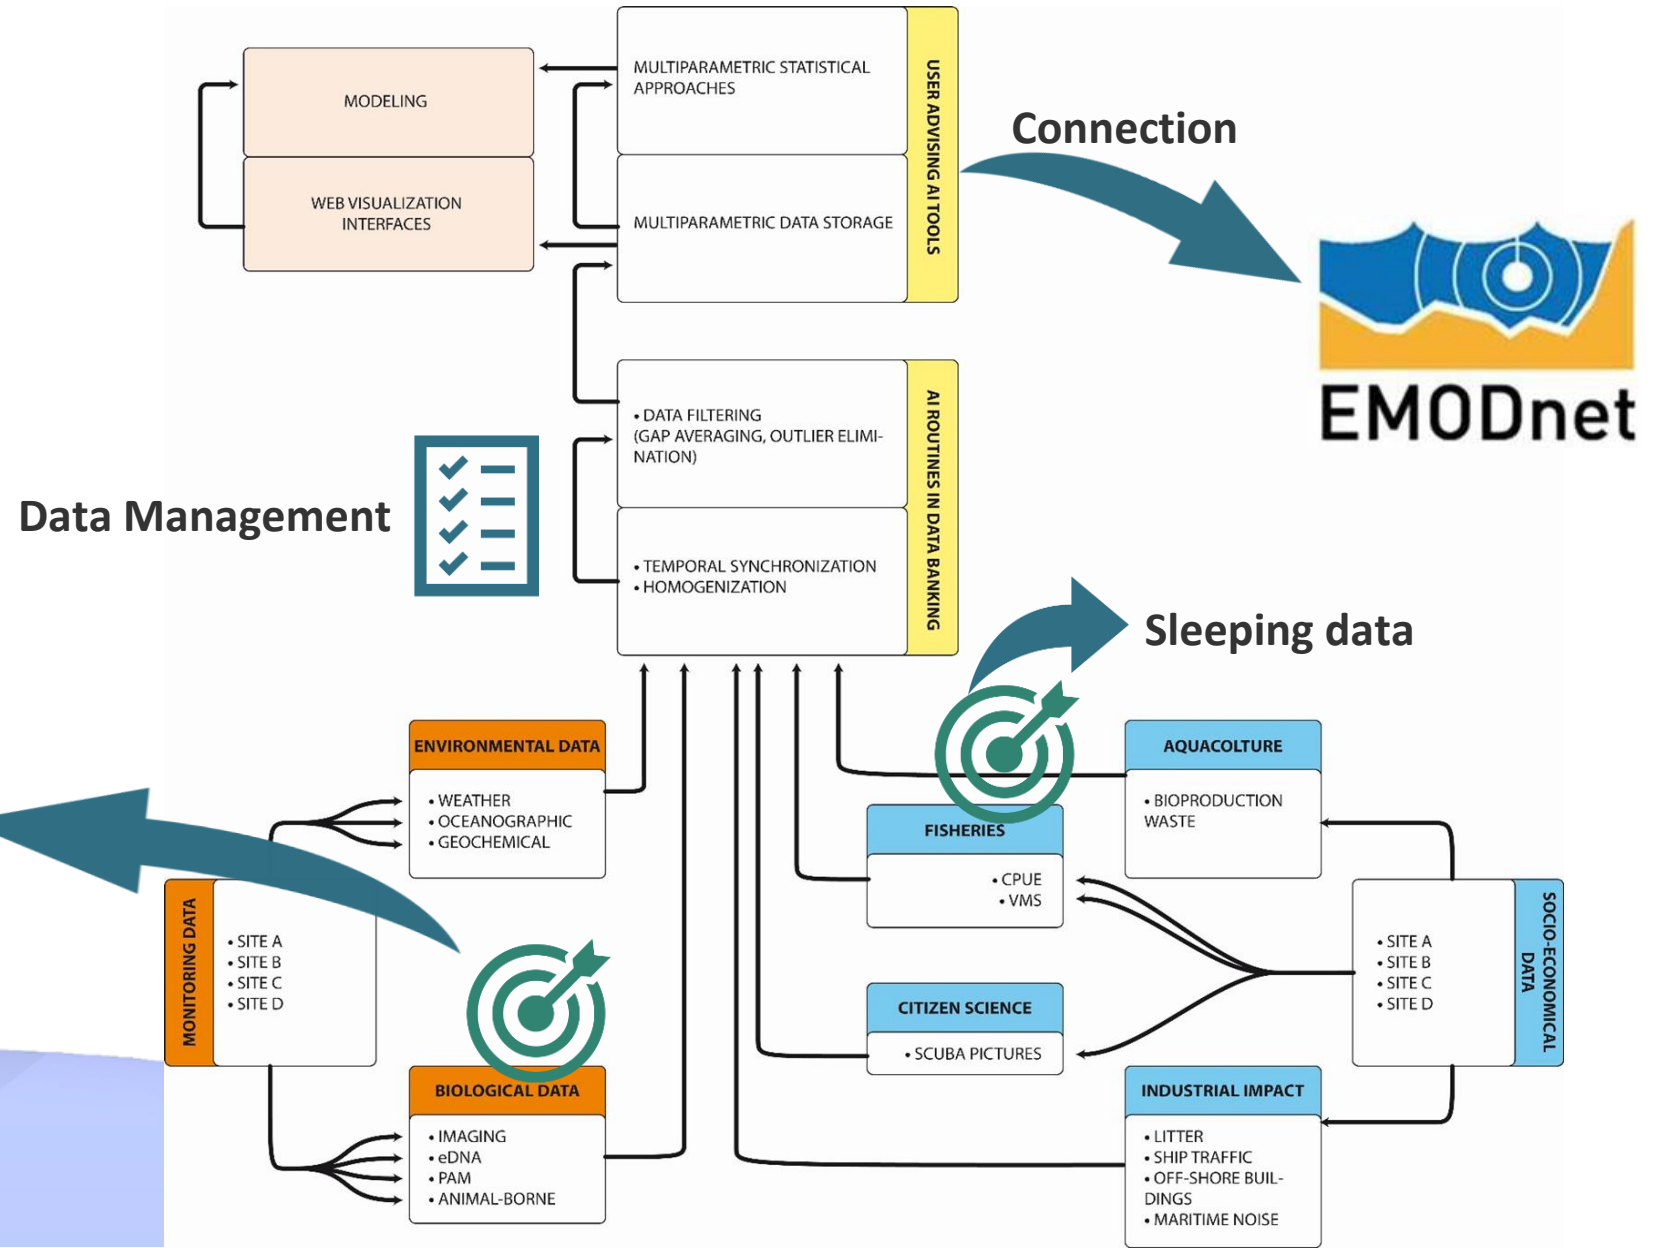

# Four strategic areas for fixed PTOs

**Detection and time series:**  
Imaging/eDNA/PAM/animal-borne

**Project name:** Digital Twin-sustained 4D ecological monitoring of restoration in fishery depleted areas (DIGI4ECO)

**Project coordinator:** J. Aguzzi

**Presented by:** J. Aguzzi (ICM-CSIC) and M. Clavel-Henry (GEOMAR)

**Aim of the project:**

Implement robotic networks for demo-missions delivering real-time data to be merged with historical and sleeping data, allowing comparisons for spatial scaling and temporal modelling

**Type of biological data collected:**

Imaging, eDNA, PAM, oceanographic and geochemical data, socioeconomical and sleeping entries (e.g., recreational commercial catches)

**Geographical area:**

Western and Eastern Mediterranean, North Sea and Eastern Atlantic

## Data availability, management, connection with EMODnet

### ► Data Availability:

- **Image data sets** for time series of species counts (megafauna; manual and AI processing)
- **PAM and eDNA** for augmented species detectability;
- Sleeping and socio-economic data

### ► Management:

- **Raw data storage** at each demo-site, processed for harmonization and stored/**managed** by ICATMAR (Spain) central bank repository;
- **Data quality** based on metadata labelling is provided.

### ► Connection with EMODnet:

- The project can create **a continuous pipeline of biological data** into EMODnet based on the expertise of UPC/MI (which are already data providers).

**EMODnet**

# Darwin Core: The scope

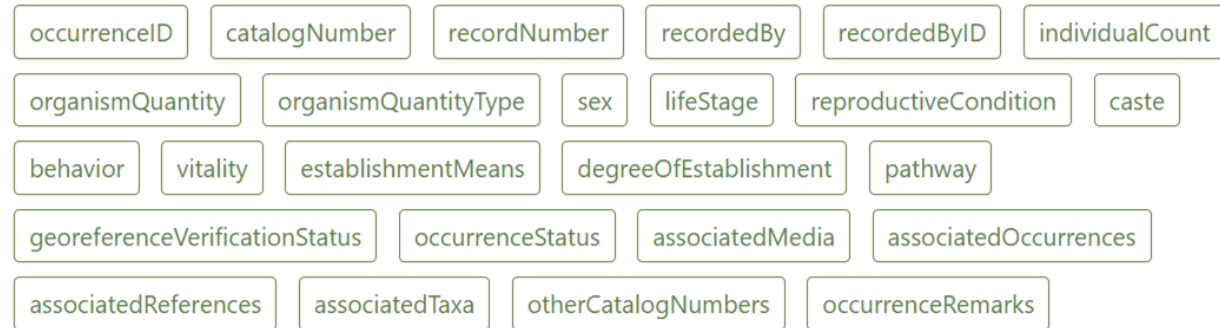

Darwin Core is a standard maintained by the Darwin Core Maintenance Interest Group. It includes a glossary of terms (in other contexts these might be called properties, elements, fields, columns, attributes, or concepts) intended to **facilitate the sharing of information about biological diversity** by providing identifiers, labels, and definitions. Darwin Core is primarily based on taxa, their occurrence in nature as documented by observations, specimens, samples, and related information.

# Darwin Core: The terms

## List of terms

### - Standardized

### - Maintained

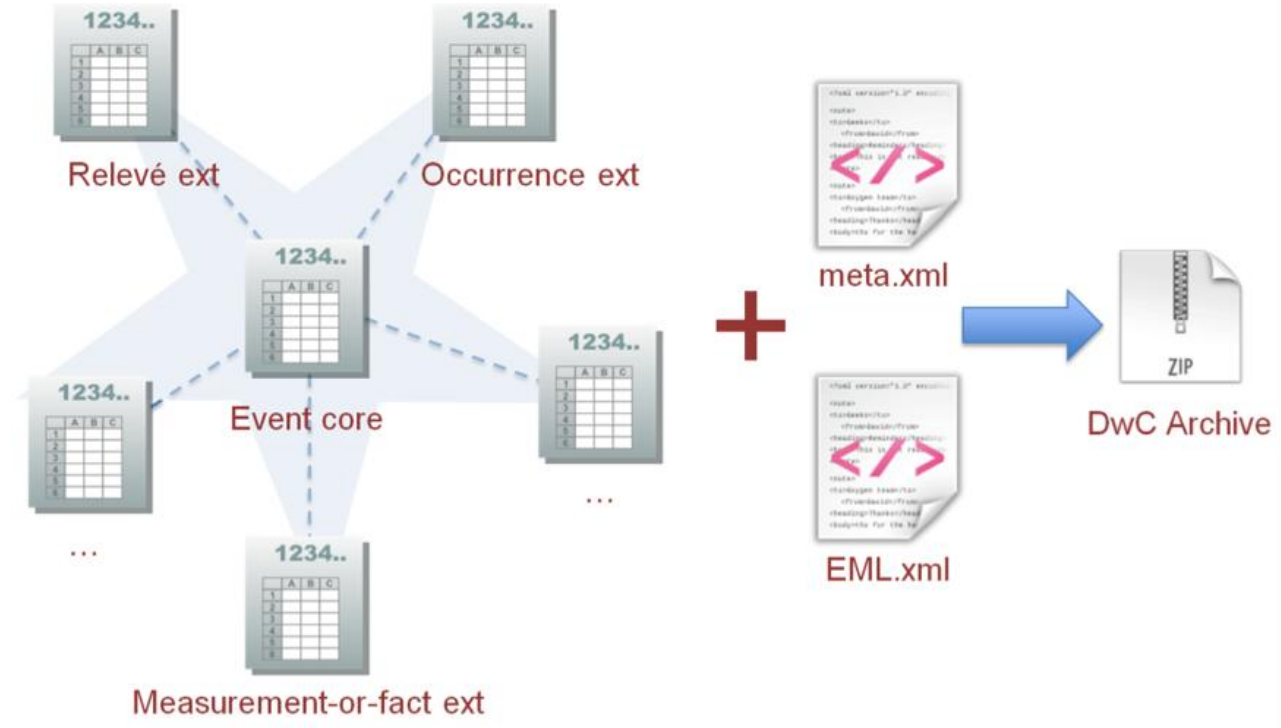

#### basisOfRecord

Identifier	<a href="http://rs.tdwg.org/dwc/terms/basisOfRecord">http://rs.tdwg.org/dwc/terms/basisOfRecord</a>
Definition	The specific nature of the data record.
Comments	Recommended best practice is to use a controlled vocabulary such as the set of local names of the identifiers for classes in Darwin Core.
Examples	<p><b>MaterialEntity</b></p> <hr/> <p><b>PreservedSpecimen</b></p> <hr/> <p><b>FossilSpecimen</b></p>

Data flows

Darwin Core

DNA derived  
data

Publishing  
data

Quality  
Control

# DNA derived data

- Information from molecular studies (metabarcoding, qPCR, metagenomics)
  - Raw information stored in sequence databases
  - Not only useful for phylogenetic research or molecular ecology
  - ‘Occurrences’ can be derived
    - Coordinates + date + taxonomic information
  - Submitting derived occurrences to a biodiversity database makes them useful in a broader context
  - Valuable source of information
    - Undescribed taxa
    - Inconspicuous / unobservable taxa

# DNA derived data – Transformation to DwC

- Additional extension needed:
  - DNA derived data extension
    - Terms from:
      - MlXS
      - GGBN
      - MIQE
  - Occurrence Core
    - Recent development: Event Core possible

# DNA derived data – Transformation to DwC

# DNA derived data – Transformation to DwC

- 1) Transform data tables
- 2) Document additional (meta)data (enhance)
  - Same as other datasets (e.g. basisOfRecord, sampling protocol, etc.)
  - But also DNA specific information:
    - Link to raw sequences
    - Primers
    - Target locus
    - Total number of reads in sample
    - Bio-informatic methods (otu/asv generation / taxonomic annotation)
      - Software + version + parameters
      - Reference database
    - Taxonomic ID from other taxonomic database (eg. NCBI)
    - ...
- Which info to which DwC term ? follow this guide: [Publishing DNA-derived data through biodiversity data platforms](#)

# DNA derived data – Resources

- [GBIF Guidelines: Publishing DNA-derived data through biodiversity data platforms](#)
  - [OBIS Manual: DNA derived data](#)
  - EMODnet Biology DNA derived data guidelines: coming May 2025
  - [Ocean Teacher Biological Data Management Course](#): chapter on DNA derived data
  - [GBIF Metabarcoding Data Toolkit](#): Tool to convert metabarcoding datasets to DwC (pilot phase)
- 
- Recent developments ? feedback on guidelines welcome

 European Marine  
Observation and  
Data Network

## The Integrated Publishing Toolkit (IPT)

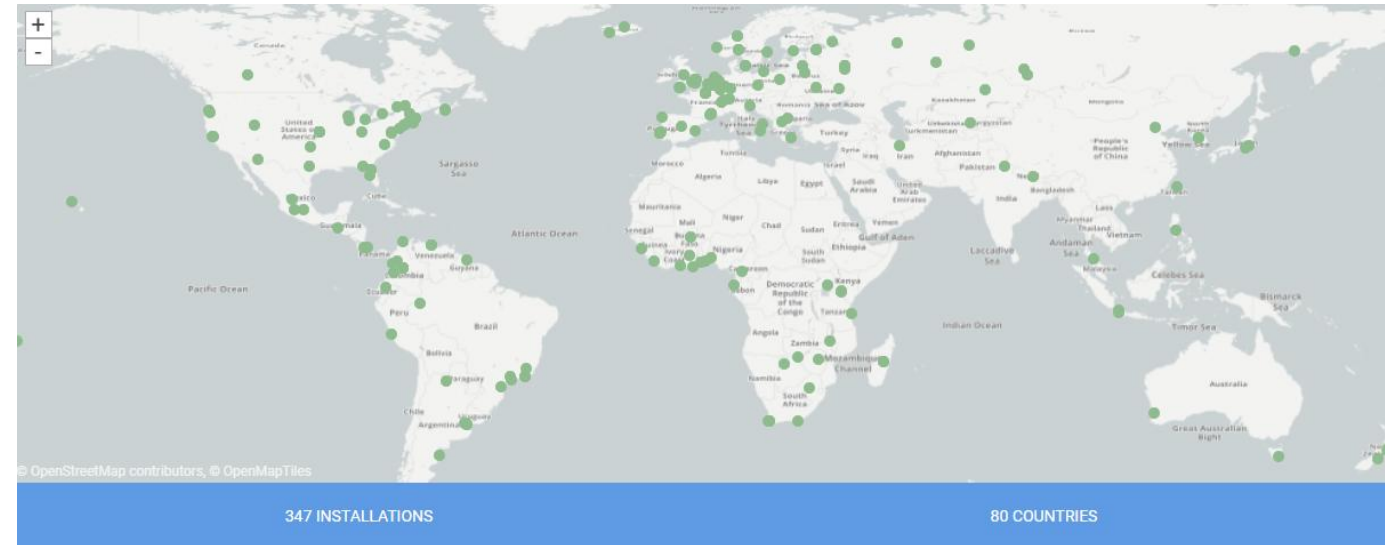

# Concept

“The Integrated Publishing Toolkit (IPT) is a free open-source software used to create and manage distributed data repositories that share biodiversity data into the GBIF network”

# Concept

- Data repository
- Creation of Darwin Core archive files
- Creation of data paper templates
- Automated data flow with OBIS/GBIF

- Limited to GBIF formats and scope

# Publishing data

- Uploading data
- Mapping data to Darwin Core
- Filling in Metadata
- Publishing

- .txt, .csv, .xlsx, .zip, DwC-A files
- DB connection
- URL
- Manual to Automated
- Allows data modifications
- Manual or via EML.xml file
- Quality Control checks

# EMODnet Biology data submission guidance

Darwin Core

DNA derived  
data

Publishing  
data

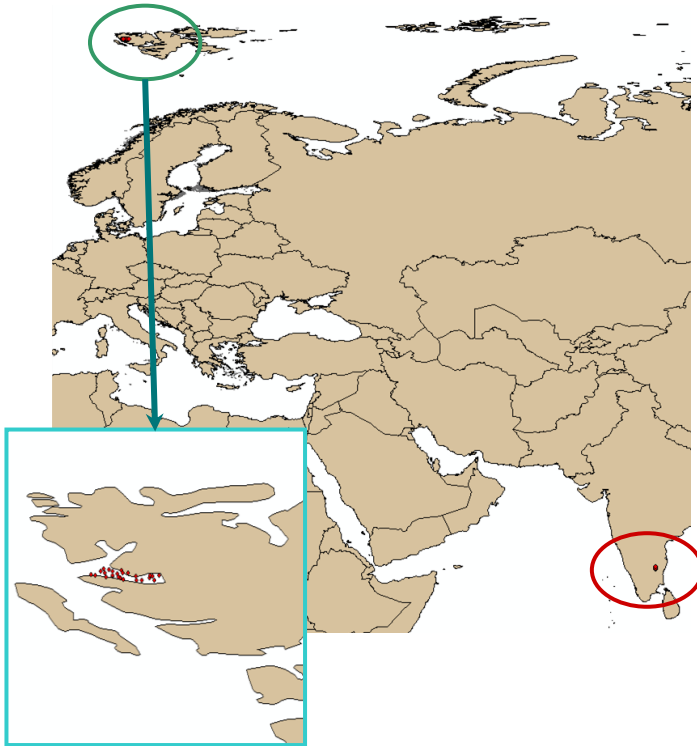

Quality  
Control

# Definition

“In data management, Quality control is the process of identifying and correcting inaccuracies or inconsistencies in data to ensure its accuracy, completeness and reliability.”

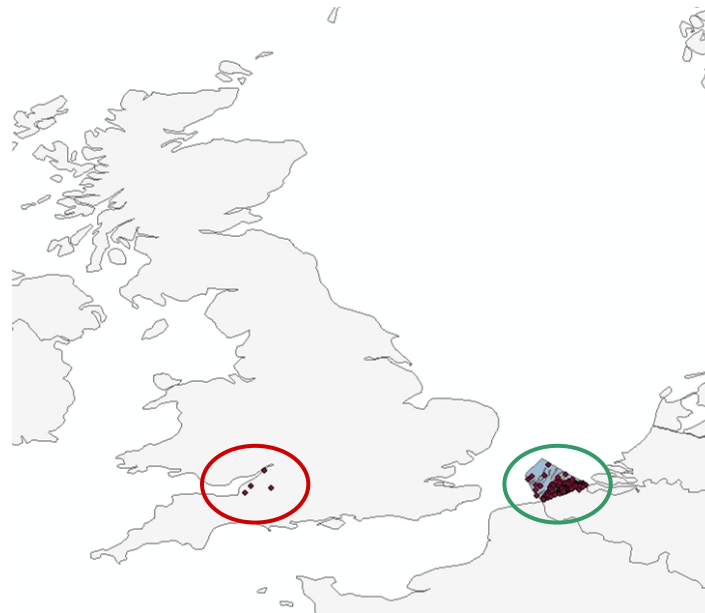

# Rationale

“Monitoring in Kongsfjorden area”

Latitude & longitude switched

“Monitoring in Belgian part of the North Sea”

“+” & “-” signs switched

# Rationale

Species names before quality control					Species names after quality control					
	# Species	# Rare species	$H'$	$1 - D$	ES50	# Species	# Rare species	$H'$	$1 - D$	ES50
Rocky shore data										
ANE	219	15	4.63602	0.98777	38.11	187	11	4.45772	0.98509	36.25
Arctic	646	69	6.00024	0.99666	46.33	378	44	5.38261	0.99403	43.67
Mediterranean	1,120	238	5.74091	0.99342	43.35	834	159	5.49015	0.99105	41.74
North Sea	251	29	4.50662	0.98424	35.89	163	25	3.95956	0.97469	30.14

*“From 6,172 unique taxon names [...] to 4,525, mostly due to spelling variations and synonymy.”*

*“... Such [taxonomic] quality control is highly needed, since a misspelled or obsolete name could be compared to the introduction of a rare species, with adverse effects on further (biodiversity) calculations...”*

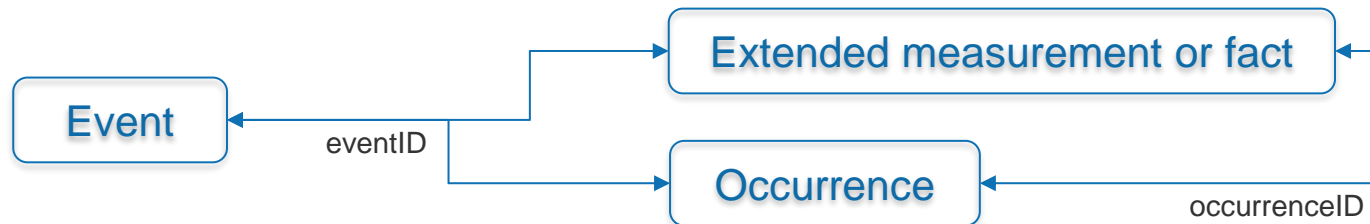

Source: Vandepitte et al. (2010)

# What needs to be QCed

- Adherence to chosen standard
- Content format (dates, coordinates, etc.)
- Unique value fields (IDs)
- Duplicated records and redundant information
- Impossible values and outliers
- Mandatory data
- Completeness (units, geodetic datums, etc.)
- ...

EVERYTHING

# EMODnet Biology product guidance

Workshop for EU funded projects

Salvador Jesús Fernández Bejarano VLIZ / EMODnet Biology WP3

19<sup>th</sup> and 20<sup>th</sup> November 2024, Online

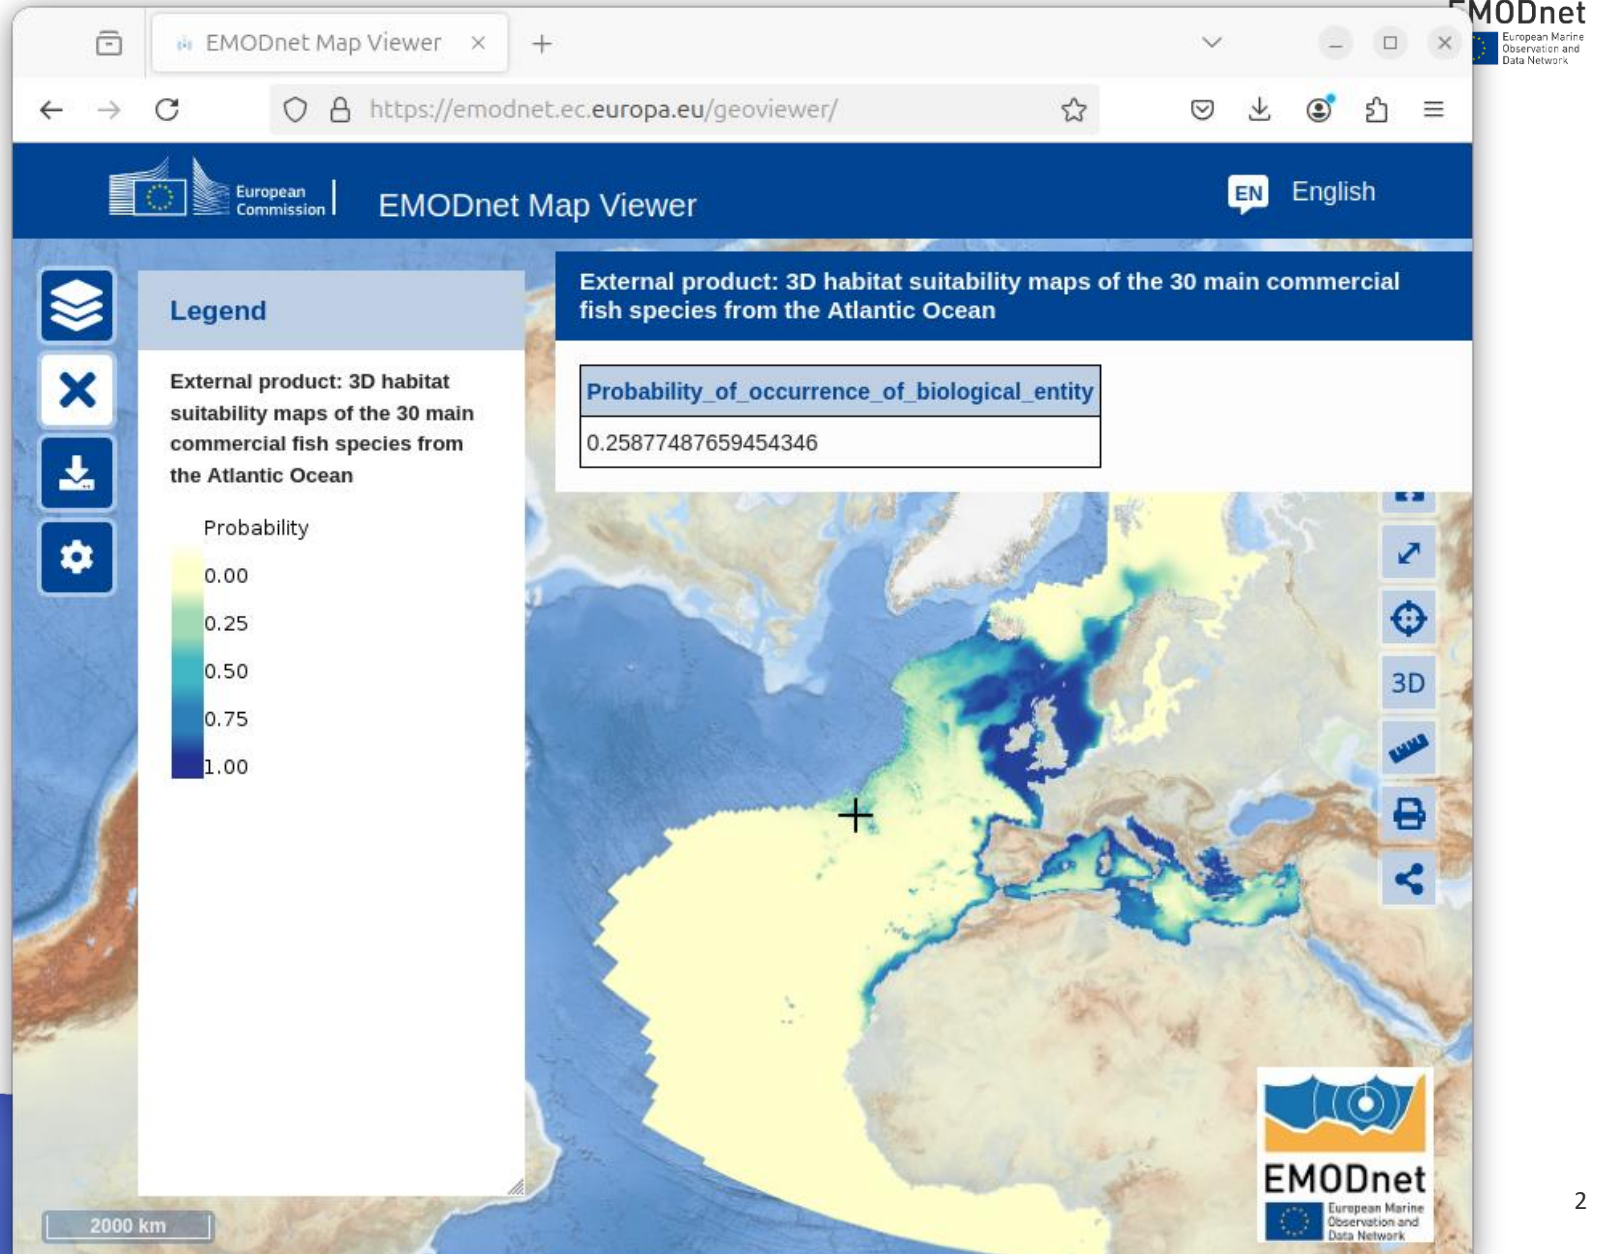

The European Marine Observation and Data Network (EMODnet) is financed by the European Union under Regulation (EU) 2021/1139 of the European Parliament and of the Council of 7 July 2021 establishing the European Maritime, Fisheries and Aquaculture Fund<sup>1</sup>.

# What is a data product?

A geospatial file. Typically raster. In certain cases, the data might be of vector type.

If Raster -> **NetCDF**

If Vector -> GPKG, SHP, GeoJSON...

# What is a data product?

Free Open Source Software

emodnet.wfs 2.0.2.9000

## emodnet.wfs: Access EMODnet Web Feature Service data through R

The goal of emodnet.wfs is to allow interrogation of and access to [EMODnet's, European Marine Observation and Data Network, geographic vector data](#) in R through the [EMODnet Web Feature Services, Web Feature services \(WFS\)](#) represent a change in the way geographic information is created, modified and exchanged on the Internet and offer direct fine-grained access to geographic information at the feature and feature property level. emodnet.wfs aims at offering an user-friendly interface to this rich data.

## Installation and setup

You can install the development version of emodnet.wfs from GitHub with:

```
# install.packages("pak")
pak::pak("EMODnet/emodnet.wfs")
```

If you want to avoid reading messages from emodnet.wfs such as "WFS client created successfully", set the "emodnet.wfs.quiet" option to `TRUE`.

```
options("emodnet.wfs.quiet" = TRUE)
```

# NetCDF

A netCDF file is a format for storing multi-dimensional data. It contains **dimensions** and **variables**:

- **Dimensions:** Define the shape of data, with measurements like location, time, or climate change scenarios.
- **Variables:** Store main data arrays with defined names, types, and shapes, like temperature or abundance.
  - **Coordinate Variables:** special case of variables representing the dimensions in 1D arrays.

```
netcdf mynetcdf {  
  dimensions:  
    x=4;  
    y=4;  
    time=UNLIMITED;  
  variables:  
    float x(x);  
    float y(y);  
    int time(time);  
    float temperature(time,x,y);  
  data:  
    x = 10, 20, 30, 40;  
    y = 110, 120, 130, 140;  
    time = 31, 59, 90;  
  
  Temperature = 111, 211, 311, 411, 121, 221, 321,  
    421, 131, 231, 331, 431, 141, 241, 341, 441;  
}
```

# Why NetCDF

- A centralized system was chosen for data sub-setting and downloads, requiring all thematic lots to maintain OGC web services (e.g., WMS, WFS, WCS).
- ERDDAP was selected as it supports gridded and tabular datasets, with an EMODnet ERDDAP instance set up for products from Chemistry, Physics, and other thematic lots.
- Biology's data delivery via a map viewer was limited to selected taxa, so creating NetCDFs for ERDDAP upload was identified as the optimal solution.
- This approach meets Central Portal requirements without needing custom solutions.

ERDDAP server @ EMODnet  
Easier access to scientific data

## Data management hell

- No standard way of organizing files
- Dimensions are contained in the file names (or folder names!!!)
- No metadata

# Why NetCDF

```
$ ncdump -h file.nc
netcdf \file {
dimensions:
    aphiaid = 49 ;
    lat = 63 ;
    lon = 79 ;
    time = 6 ;
    emmision_scenario = 3 ;
variables:
    int aphiaid(aphiaid) ;
        aphiaid:long_name = "Life Science Identifier - World Register of Marine Species" ;
        aphiaid:units = "level" ;
    double lat(lat) ;
        lat:units = "degrees_north" ;
        lat:standard_name = "latitude" ;
        lat:long_name = "Latitude" ;
    double lon(lon) ;
        lon:units = "degrees_east" ;
        lon:standard_name = "longitude" ;
        lon:long_name = "Longitude" ;
    double time(time) ;
        time:standard_name = "time" ;
        time:long_name = "Time" ;
        time:units = "days since 1970-01-01 00:00:00" ;
        time:calendar = "gregorian" ;
    int emmision_scenario(emmision_scenario) ;
        emmision_scenario:long_name = "Climate Change Emission Scenarios" ;
        emmision_scenario:units = "level" ;
    double probability_of_occurrence(time, emmision_scenario, aphiaid, lat, lon) ;
        probability_of_occurrence:FillValue = -99999. ;
        probability_of_occurrence:long_name = "Probability of occurrence of biological entity" ;
}
```

- All data in one single file
- Data organized in a 5 dimensions array, including species (aphiaid), time and emission scenario.
- The file includes metadata and CF compliant standard names names.

## COARDS

Set of rules to organize **geospatial data in a NetCDF file**:

- Basic data structure with **coordinate variables**: lon, lat, depth and time. These must be **numeric** and **monotonic**.
- Longitude and latitude are structured in **regular grids**.
- Time must be stored as **numbers** (e.g., days since 1970-01-01 00:00:00).
- All coordinate variables require units, even if they don't have.

## CF (Climate Forecast)

More flexible than COARDS, aimed to **increase interoperability**:

- Coordinate variables have **standard\_name**, **units**, and **spatial referencing** attributes. **Coordinate variables can be characters**.
- Support **multi-dimensional variables** and consistent handling of **missing values**.
- Global Attributes: Provide self-explanatory and extensive metadata for **increased interoperability**.
- All coordinate variables require units, even if they don't have.

# The taxon dimension

## The CF way

<https://cfconventions.org/cf-conventions/cf-conventions.html#taxon-names-and-identifiers>

```
dimension:
  time = 100 ;
  string80 = 80 ;
  taxon = 2 ;
variables:
  float time(time);
    time:standard_name = "time" ;
    time:units = "days since 2019-01-01" ;
  float abundance(time,taxon) ;
    abundance:standard_name = "number_concentration_of_biological_taxon_in_sea_water" ;
    abundance:coordinates = "taxon_lsid taxon_name" ;
  char taxon_name(taxon,string80) ;
    taxon_name:standard_name = "biological_taxon_name" ;
  char taxon_lsid(taxon,string80) ;
    taxon_lsid:standard_name = "biological_taxon_lsid" ;
data:
  time = // 100 values ;
  abundance = // 200 values ;
  taxon_name = "Calanus finmarchicus", "Calanus helgolandicus" ;
  taxon_lsid = "urn:lsid:marinespecies.org:taxname:104464", "urn:lsid:marinespecies.org:taxname:104466"
;
```

# The taxon dimension

## The EMODnet Biology way

```
dimension:
  time = 100 ;
  string80 = 80 ;
  aphiaid = 2 ;
variables:
  float time(time);
    time:standard_name = "time" ;
    time:units = "days since 2019-01-01" ;
  float abundance(time,aphiaid) ;
    abundance:standard_name = "number_concentration_of_biological_taxon_in_sea_water" ;
  float aphiaid(aphiaid);
    aphiaid:long_name = "Life Science Identifier - World Register of Marine Species";
    aphiaid:units = "level";
  char taxon_name(aphiaid,string80) ;
    taxon_name:standard_name = "biological_taxon_name" ;
  char taxon_lsid(aphiaid,string80) ;
    taxon_lsid:standard_name = "biological_taxon_lsid" ;
data:
  time = // 100 values ;
  abundance = // 200 values ;
  aphiaid = 104464, 104466;
  taxon_name = "Calanus finmarchicus", "Calanus helgolandicus" ;
  taxon_lsid = "urn:lsid:marinespecies.org:taxname:104464", "urn:lsid:marinespecies.org:taxname:104466"
;
```

# Climatological statistics

Example: Species distribution models of habitat suitability for future decades:

- CF allows climatological statistics over specific time ranges
- A special time axis represents each time range with a single point (e.g., mid-decade).
- The "climatology" attribute defines the start and end intervals for each range.
- "Cell methods" describe how statistics are calculated (e.g., mean or maximum)

```
dimensions:
  time = 3;
  nv = 2;
variables:
  float habitat_suitability(time);
    habitat_suitability:long_name = "habitat suitability for species";
    habitat_suitability:cell_methods = "time: mean within years time: mean over years";
    habitat_suitability:units = "probability";
    habitat_suitability:_FillValue = -999.9;
  double time(time);
    time:climatology = "climatology_bounds";
    time:units = "days since 2000-1-1";
    time:calendar = "gregorian";
  double climatology_bounds(time, nv);
data:
  time = "2045-1-1", "2055-1-1", "2065-1-1";
  climatology_bounds = "2040-1-1", "2049-12-31",
                      "2050-1-1", "2059-12-31",
                      "2060-1-1", "2069-12-31";
```

# Climate change scenarios and other dimensions

In some studies, there are data modelled for different climate change scenarios. In other cases, there are specific dimensions for which data have been modelled.

There is no standard yet for these cases.

Our solution: create a dimension with coordinate variable as numeric series (e.g. 1, 2, 3...). And one more variable of type character that labels the coordinate variable

```
dimensions:
  time = 3;
  string80 = 80;
  emission_scenario = 2;
variables:
  double time(time);
    time:standard_name = "time";
    time:long_name = "Time";
    time:units = "days since 1970-01-01 00:00:00";
    time:calendar = "gregorian";
  int emission_scenario(emission_scenario);
    emission_scenario:long_name = "Climate Change Emission Scenarios";
    emission_scenario:units = "level";
    emission_scenario:description = "1 = RCP 4.5; 2 = RCP 8.5";
  char emission_scenario_char(emission_scenario, string80);
    emission_scenario_char:long_name = "Climate Change Emission Scenarios CHAR";
  double probability_of_occurrence(time, emission_scenario);
    probability_of_occurrence:_FillValue = -99999.0;
    probability_of_occurrence:long_name = "Probability of occurrence of biological entity";
data:
  time = 18263, 18628, 18993;
  emission_scenario = 1, 2;
  emission_scenario_char = "RCP 4.5", "RCP 8.5";
```

# Standardizing variables

No CF standard names exist for common metrics in biodiversity

- Habitat suitability
- Probability of occurrence
- Shannon index
- Species loss
- ...

We are working in **aligning** the terms we use and submit **controlled vocabularies**.

Biology

EMODnet Biology provides open and free access to interoperable data and data products on temporal and spatial distribution of marine species (angiosperms, benthos, birds, fish, macroalgae, mammals, phytoplankton, reptiles, zooplankton) and species traits from European regional seas, as defined by the EEA's 'Europe's seas' dataset (Arctic Ocean, (North) Atlantic Ocean, Baltic Sea, Black Sea, Mediterranean Sea and North Sea).

Product published during Phase IV: Temporal Turnover in European Macrobenthos Communities (Webb, T.J. (2023)). [View the map in the EMODnet map viewer.](#)

Key services

EMODnet Biology provides key services and products which allow users to search and visualise data and related data products:

+ Webservices

+ IPT

+ QC Tool

+ Online course (MOOC): "Contributing datasets to EMODnet Biology"

+ EMODnetWCS: Access EMODnet Web Coverage Service data through R

+ EMODnetWFS: Access EMODnet Web Feature Service data through R

+ R package: BTrait - working with biological data and trait information

+ Darwin Core data file template

## – Webservices

- Occ
- mea
- Retr
- Usin
- Usin
- Exa

### – EMODnetWCS: Access EMODnet Web Coverage Service data through R

The [R package](#) , partially funded by EMODnet thematic lots' raster data lay users to query information on and dow Coverage Service (WCS) endpoints di

### – Darwin Core data file template

The following [file](#) includes information about the mandatory and recommended fields for data submission to EMODnet Biology. Please contact us via [bio@emodnet.eu](mailto:bio@emodnet.eu) if you have any questions.

- inform

### – EMODnetWFS: Access EMODnet Web Feature Service data through R

The [R package](#) , created by EMODnet Biology partners, is designed to make all EMODnet thematic lots' vector data layers easily accessible in R. The package allows users to query information on and download data from all available EMODnet Web Feature Service (WFS) endpoints directly into their R working environment.

## Services

EMODnet Biology provides key services and products which allow users to search and visualise data products:

### services

### – R package: BTrait - working with biological data and trait information

[BTrait](#)  was developed in the scope of EMODnet Biology to facilitates working with species density data, combined with species traits in R. It allows users to query the linked datasets (species density and trait data) and visualise it with an interactive shiny application.

+ QC Tool

+ Online course (MOOC): "Contributing datasets to EMODnet Biology"

+ EMODnetWCS: Access EMODnet Web Coverage Service data through R

  - "Contributing and publishing datasets to OBIS"
  - <https://classroom.oceanteacher.org/course/view.php?id=907>

# Templates, guidelines

- **Darwin Core (DwC) file template:** includes information about the mandatory and recommended fields for data submission to EMODnet Biology.

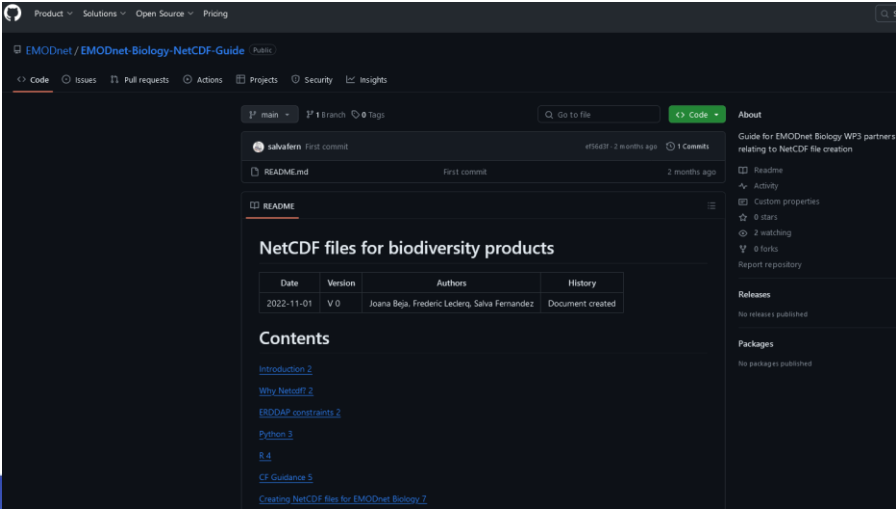

OBIS manual: <https://www.obis.org/manual/>  
DwC terms: <https://dwc.tdwg.org/terms/>

DwC OBIS-ENV schema   **Event**   Occurrence   ExtendedMeasurementOrFact   DwC Term definitions

table	rank	field name	definition
Event	Mandatory	eventID	identifier or an identifier specific to the data set
	Mandatory	eventDate	suitable for a time in a geological context.
	Mandatory	decimalLatitude	Location. Positive values are north of the Equator, negative values are south of it. Legal values lie between -90 and 90, inclusive.
	Mandatory	decimalLongitude	Location. Positive values are east of the Greenwich Meridian, negative values are west of it. Legal values lie between -180 and 180,
	Mandatory	institutionCode	The name (or acronym) in use by the institution having custody of the object(s) or information referred to in the record
	Mandatory	datasetName	The name identifying the data set from which the record was derived
	Highly Recommended	maximumDepthInMeters	The greater depth of a range of depth below the local surface, in meters
	Highly Recommended	minimumDepthInMeters	The lesser depth of a range of depth below the local surface, in meters
	Highly Recommended	coordinateUncertaintyInMeters	whole of the Location. Leave the value empty if the uncertainty is unknown, cannot be estimated, or is not applicable (because there are radius representation (see decimalLatitude) and a footprint representation, and they may differ from each other.
	Recommendable	footprintWKT	
	parenEventID exists	type	need a field to explain what the event ( <a href="http://obis.org/manual/darwincore/#event">http://obis.org/manual/darwincore/#event</a> ) refers to (sample, subsample, stationVisit,...)   2. this
	Mandatory if exists	parenEventID	An identifier for the broader Event that groups this and potentially other Events.
	Other	dataGeneralizations	may be available on request
	Other	eventRemarks	Comments or notes about the Event
	Other	samplingProtocol	The name of, reference to, or description of the method or protocol used during an Event
	Other	locationID	specific to the data set
	Other	locality	(higherGeography, continent, country, stateProvince, county, municipality, waterBody, island, islandGroup). This term may contain
	Other	locationRemarks	Comments or notes about the Location

# Tools

- In collaboration with LifeWatch Belgium we developed a **data QC tool**
  - Available as an rshiny application (<https://rshiny.lifewatch.be/BioCheck/>) or
  - R Package (<https://github.com/EMODnet/EMODnetBiocheck>)
- VLIZ hosts and provides technical support for > 30 IPT instances
  - IPT for data sharing (<https://ipt.vliz.be/eurobis>)
- We have developed R Packages for EMODnet webservices
  - For WCS services (<https://github.com/EMODnet/EMODnetWCS>) and
  - For WFS services (<https://github.com/EMODnet/EMODnetWFS>)
- Webservices
  - Data and products available via [VLIZ](#) or [EMODnet CP](#) Geoserver instances and via [EMODnet CP ERDDAP](#) instance
  - Guidance available via <https://github.com/EMODnet/EMODnet-Biology-Guidance>

## LifeWatch & EMODnet Biology QC tool

The screenshot shows the web interface of the LifeWatch & EMODnet Biology QC tool. At the top, there are navigation tabs: 'Data overview' (selected), 'Issues found', 'Issues on map', 'Invalid Event Records', 'Invalid Occurrence Records', and 'Invalid eMoF Records'. Below these are links for 'OBIS Event Hierarchy tree' and 'About'. On the right side, there are buttons for 'URL' and 'File', and a section for 'Link to IPT resource' with a text input field containing 'http://ipt.vliz.be/training/'. Below that is a section for 'Add event hierarchy tree?' with a dropdown menu set to 'no' and a 'Load' button. The main content area contains a welcome message and instructions on how to use the tool, including a link to the 'About' tab and a 'Download' button. At the bottom, there is a footer with the LifeWatch logo and the text 'This service is powered by LifeWatch Belgium' and a 'Learn more' link.
